

OS image for UC-3400A Series (MIL v3.4) Release Notes

Version: v1.1 Build: 25052801

Release Date: Sep 19, 2025

Applicable Products

UC-3400A Series

Supported Operating Systems

Moxa Industrial Linux 3 (Debian 11)

New Features

- Supports mDNS for device discovery with the default port 5353 enabled.
- Moxa Connection Manager (MCM):
- Adds the "dyn_conf" option to the "moxa-connect-manager" command to modify the configuration cache.
- Supports "Multi-WAN", a new interface type to route traffic to the interface from which it

Enhancements

• EN 18031-1 (RED) compliant wireless cybersecurity.

To comply with EN 18031-1 wireless cybersecurity, the standard version of Moxa Industrial Linux (MIL) 3.4 includes the following changes:

- Adds a PAM login policy
 - The "pam_tally2" mechanism locks the account for 300 seconds after five failed login attempts.
- Disables SNMPv1 and SMNPv2.
- Moxa Guardian (MG): Adds a new mode 4 in moxa-guardian.
- Moxa Computer Interface Manager (MCIM):
- Adds a snapshot script for the push-button.
- The auto-mount partition feature provides additional log information to verify the success or failure of the mount operation.
- Supports new DIO commands: add/delete/list/set hook scripts.
- Supports new button commands: add/delete/list action scripts.
- Moxa Connection Manager (MCM):
- Adds RSSI and RSRQ signal values.
- Supports up to two IP target hosts for the ping mechanism.
- Supports recovery of the cellular module when it unexpectedly stops responding
- Moxa System Decommission (MSM): Enhances the "moxa-system-manager" decommission workflow to improve resilience against interruptions, such as power failures, ensuring reliable system decommissioning.
- All tools: Adds a "-J" command option to support JSON format output for Moxa tools, including MCIM, MCM, MBM, and MSU.
- The Ethernet DHCP client ID, previously fixed to the client's MAC address, can now be configured/modified.
- The username and password fields are auto-populated when the credentials are available in the APN profile data.
- The log-rotate strategy for standard models has been adjusted to apply daily rotation with 14 logs retained in the rsyslog group.

Bugs Fixed

- Configuring eth0 as a Docker interface causes the MCM tool to fail.
- Moxa Bootloader Manager (MBM): The bootloader log is displayed incorrectly in cases where it wraps (e.g., in a circular buffer).

Changes

- Moxa Computer Interface Manager (MCIM): Deprecates the "user-defined" option for a button. Use the "add_action" command to add an action script for unique names.
- Moxa Connection Manager (MCM): The DHCP server will be enabled by default when the Ethernet interface is configured as a LAN.

Notes

- The standard models of the UC-1200A, UC-2200A, UC-3400A, UC-4400A, and UC-8200 Series can achieve EN 18031-1 (RED) compliant wireless cybersecurity via two methods:
- Clean OS installation: The default system is preconfigured to comply with EN 18031-1 (RED) compliant wireless cybersecurity requirements.
- System upgrade: After upgrading to the latest OS version, execute the mx-guardian red set command to ensure EN 18031-1 (RED) compliant wireless cybersecurity.
- The "SNR metric" has been renamed to "SINR for LTE/NR cellular interfaces" in both the CLI and D-Bus interfaces.
- Known Issues:

Using the command "mx-sw-updater upgrade --local" to upgrade the system may fail if the device does not have Internet access.

The root cause is that the default installation strategy of "moxa-software-updater" (aligned with APT package management tool) also includes "Recommends" (not mandatory for the standard releases) packages, which may need Internet access to install.

Workaround: Before performing the upgrade, run the command "echo 'APT::Install-Recommends "false";' I sudo tee /etc/apt/apt.conf.d/99no-recommends" to exclude the "Recommends" packages from the installation process. After the upgrade is complete, run the command "sudo rm -f /etc/apt/apt.conf.d/99no-recommends" to remove this temporary setting.
