EN 50155 Compliance

- The EN 50155 standard defines mandatory and other criteria for electronic products that are used with railway rolling stock applications in the European free-trade region. The standard covers conditions of operation, reliability and maintainability, components, construction, safety, documentation, design of both hardware and software, and the types of testing that are required.
- Moxa products that comply with "EN 50155 mandatory test items" have passed at least those EN 50155 test items identified as mandatory by the EN 50155 standard, as well as other requirements, such as conformal coating. Such products are suitable for the vast majority of railway rolling stock applications.
- Moxa products designated as EN 50155 compliant have been tested by an independent testing agency. The EN 50155 DoC (Declaration of Conformity) of such products can be requested from either Moxa or a Moxa distributor.
