| F. | CN2600 Series Comparison Table | 135 | 5 |
|----|--------------------------------|-----|---|
|----|--------------------------------|-----|---|

Moxa's CN2600 series of dual-LAN terminal servers is available in models with 8 or 16 RS-232 or RS-232/422/485 ports, and all models come with two 10/100 Mbps Ethernet LAN ports. The CN2600 dual-LAN terminal servers are used to connect terminals, modems, printers, and other asynchronous serial devices to LAN hosts. The CN2600 dual-LAN terminal servers comply with TCP/IP and IEEE 802.3 specifications using standard Ethernet 10/100BaseT and twisted pair 10/100BaseTX cable as the data transmission medium.

## NOTE

In this manual, we often refer to all terminal servers in the CN2600 series collectively as the CN2600.

## NOTE

The wide temperature model does not have an LCM Display panel and push buttons. The LCM description in this manual applies only to standard temperature models.

## **Package Checklist**

All CN2600 dual-LAN terminal servers are shipped with the following items:

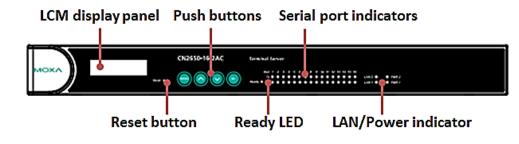

- CN2600 dual-LAN terminal server
- Power cord (AC models only)
- Quick Installation Guide (English and Simplified Chinese versions)
- RJ45 Loopback Tester
- Warranty card
- Rackmount Kit (includes 2 brackets and 8 screws)
- Desktop Kit (includes 4 pads)

## **Product Features**

The CN 2600 series has the following features:

- LCD panel for easy IP address configuration (excluding wide temperature models)
- Dual-LAN cards with two independent MAC addresses and IP addresses
- Redundant COM function available when both LANs are active
- Dual-host redundancy can be used to add a backup PC to your system
- Dual AC power inputs (AC models only)
- Real COM/TTY drivers for Windows and Linux
- Universal high-voltage range: 100 to 240 VAC or 88 to 300 VDC

## **Front Panel**

#### NOTE

Wide temperature models do not have an LCM Display Panel.

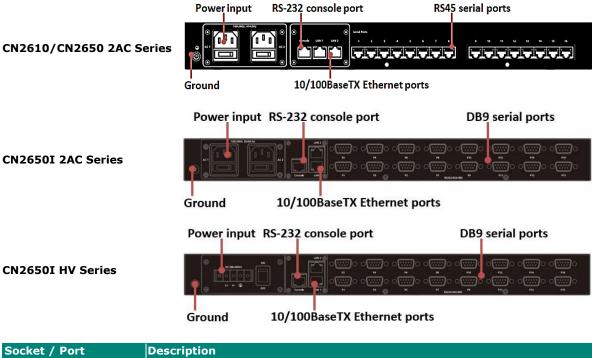

#### Buttons

| Item         | Description  |
|--------------|--|
| Reset Button | Press the Reset button for 5 seconds to load factory defaults. The CN2600 will beep twice when the configuration has been reset. |
| Push Buttons | Used for configuring the IP address and other parameters.  |

#### LEDs

| Item   | Description |   |  |
|--|-------------|---|--|
| Deady.                                       | Red         | Indicates that the CN2600 is receiving power. |  |
| Ready  | Green       | Indicates that the CN2600's OS is ready.      |  |
| Tx Green Indicates serial port transmission. |             | Indicates serial port transmission.           |  |
| Rx Yellow Indicates serial port reception.   |             | Indicates serial port reception.              |  |
| LAN 1, LAN 2                                 | Green       | Ethernet link connection.                     |  |
| LAN 1, LAN 2                                 | Off         | Ethernet cable is disconnected.               |  |
| PWR 1, PWR 2                                 | Red         | Power connection.                             |  |
| FVVR 1, FVVR 2                               | Off         | Power cable is disconnected.                  |  |

## **Rear Panel**

| SUCKEL / PUIL       | Description  |
|---------------------|--|
| AC Power Input      | Automatic detection of 100 to 240 V, 47 to 63 Hz AC power supply |
| DC Power Input      | Automatic detection of 88 to 300 V                               |
| Power On/Off Switch | I indicates power on; O indicates power off (AC models only)     |
| Console             | 8-pin RJ45 RS-232 port for console terminal connection           |
| LAN 1               | 8-pin RJ45 auto-detectable 10/100 Mbps UTP port                  |
| LAN 2               | 8-pin RJ45 auto-detectable 10/100 Mbps UTP port                  |
| Serial Ports        | 8 or 16 8-pin RJ45 or DB9 ports for DCE modem-type connections   |

This chapter includes instructions on where and how to install the CN2600 dual-LAN terminal server. Both basic and advanced software configuration instructions are given.

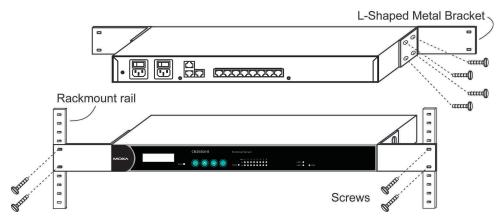

## Desktop

Place your CN2600 on a clean, flat, well-ventilated desktop. For better ventilation, attach the 4 pads from the desktop kit to the bottom of the unit, and leave some space between the CN2600 and other equipment. Do not place equipment or objects on top of the unit, as this might damage the server.

|                  |     | Pads |
|------------------|-----|------|
| Bottom of CN2610 | 0   | 31/  |
| Bottom of CN2610 | 0 0 | 5    |

## Rackmount

The CN2600 is designed to be mounted on a standard 19-inch rack. Use the enclosed pair of L-shaped metal brackets and screws to fasten your CN2600 to the rack cabinet. Each L-shaped bracket has 6 holes, leaving two outer or inner holes available for other uses. You have two options. You can lock either the front or rear panel of the CN2600 to the front of the rack. Locking the front panel is shown in the following figure.

## **Wiring Requirements**

#### ATTENTION

#### Safety First!

Be sure to disconnect the power cord before installing and/or wiring your CN2600.

#### Wiring Caution!

Calculate the maximum possible current in each power wire and common wire. Observe all electrical codes dictating the maximum current allowable for each wire size.

If the current goes above the maximum ratings, the wiring could overheat, causing serious damage to your equipment.

#### Temperature Caution!

Be careful when handling the CN2600. When plugged in, the CN2600's internal components generate heat, and consequently the board may feel hot to the touch.

You should also observe the following common wiring rules:

• Use separate paths to route wiring for power and devices. If power wiring and device wiring paths must cross, make sure the wires are perpendicular at the intersection point.

#### NOTE

Do not run signal or communication wiring and power wiring in the same wire conduit. To avoid interference, wires with different signal characteristics should be routed separately.

- You can use the type of signal transmitted through a wire to determine which wires should be kept separate. The rule of thumb is that wiring that shares similar electrical characteristics can be bundled together.
- Keep input wiring and output wiring separate.
- Where necessary, it is strongly advised that you label wiring to all devices in the system.

## Connecting the CN2600-8/16's Power

Connect the CN2600's 100-240 VAC power line to its AC connector. If the power is properly supplied, the "Ready" LED will show a solid red color until the system is ready, at which time the color changes to green.

#### WARNING

CL 1.7.9 Isolation of multiple power sources & CL 3.4.11 Multiple power sources:

Where there is more than one connection supplying HAZARDOUS VOLTAGES or HAZARDOUS ENERGY LEVELS to equipment, a prominent marking, located close to the entry point provided for a SERVICE PERSON to gain access to the hazardous parts, shall be provided to indicate which disconnect device or devices isolate the equipment completely and which disconnect devices can be used to isolate each section of the equipment.

CAUTION: This server may be shipped with multiple power supplies that require more than one connector to AC mains. The AC power cords are considered to be the mains disconnect device for the server; always disconnect power supply cords before opening up or servicing the server.

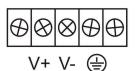

## Connecting the CN2600-8/16-HV's Power

To connect the CN2600-8/16-HV's power cord with its terminal block, follow the steps given below:

- 1. Loosen the screws on the V+ and V- terminals of the CN2600-8/16-HV's terminal block.
- 2. Connect the power cord's VDC wire to the terminal block's V+ terminal, and the power cord's DC power ground wire to the terminal block's V- terminal, and then tighten the terminal block screws.

#### NOTE

The CN2600-8/16-HV can still operate even if the DC and DC power ground are reversed.

If the power is properly supplied, the "Ready" LED will show a solid red color until the system is ready, at which time the "Ready" LED will change to a green color.

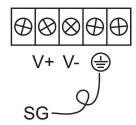

#### NOTE

You should use 8 kg-cm of screw torque and 22-14 AWG of suitable electric wire to connect the CN2600-8/16-HV's power cord to its terminal block.

## Grounding the CN2600-8/16-HV

Grounding and wire routing help limit the effects of noise due to electromagnetic interference (EMI). Run the ground connection from the ground screw to the grounding surface prior to connecting devices. The shielded ground (sometimes called protected ground) contact is the second contact from the right of the 5-pin power terminal block connector located on the rear panel of the CN2600-8/16-HV. Connect the SG wire to the Earth ground

#### ATTENTION

This product is intended to be mounted to a well-grounded mounting surface such as a metal panel.

## **Connecting to the Network**

Connect one end of the Ethernet cable to the CN2600's 10/100M Ethernet port and the other end of the cable to the Ethernet network. There are 2 LED indicators located on the top left and right corners of the Ethernet connector. If the cable is properly connected, the CN2600 will indicate a valid connection to the Ethernet in the following ways:

The top right corner LED indicator maintains a solid green color when the cable is properly connected to a 100 Mbps Ethernet network.

The top left corner LED indicator maintains a solid orange color when the cable is properly connected to a 10 Mbps Ethernet network.

## **Connecting to a Serial Device**

Use appropriately wired serial data cables to connect serial devices to the CN2600's serial ports.

## **Connecting to the Console Port**

A console is a combination of keyboard and monitor that is used to configure settings and monitor the status of your system. The console port can be used if a network is unavailable, or you do not know the CN2600's IP address. To connect to the console port, use a PC running UNIX, or a PC with terminal emulation software (e.g., HyperTerminal or PComm by Moxa; parameter settings are: baudrate = 115200 bps, parity check = None, data bits = 8, stop bits = 1, terminal type = VT100). Use an RJ45-to-DB25 or RJ45-to-DB9 cable to connect the terminal to the console port.

## Adjustable Pull High/Low Resistors for the RS-485 Port

In some critical environments, you may need to add termination resistors to prevent the reflection of serial signals. When using termination resistors, it is important to set the pull high/low resistors correctly so that the electrical signal is not corrupted. The CN2600 uses jumper settings or DIP switches to set the pull high/low resistor values for each serial port.

To set the pull high/low resistors to 150 K $\Omega$ , make sure both of the assigned DIP switches are in the OFF position. This is the default setting.

To set the pull high/low resistors to 1 K $\Omega$ , make sure both of the assigned DIP switches are in the ON position.

#### ATTENTION

Do not use the 1 K $\Omega$  setting on the CN2650 when using the RS-232 interface. Doing so will degrade the RS-232 signals, shorten the maximum allowed communication distance, and the Rx LED may light up.

When setting up the CN2600 for the first time, the first thing you should do is configure its IP address. This chapter introduces the different methods that can be used. Please refer to Chapter 8, *System Management Settings*, for more details about network settings.

## **Static and Dynamic IP Addresses**

Determine whether your CN2600 needs to use a static IP or dynamic IP address (either DHCP or BOOTP/PPPoE application).

- If your CN2600 terminal server is used in a static IP environment, you will assign a specific IP address using one of the tools described in this chapter.
- If your CN2600 terminal server is used in a dynamic IP environment, the IP address will be assigned automatically from over the network. In this case, set the IP configuration mode to DHCP, DHCP/BOOTP, BOOTP, or PPPoE.

#### ATTENTION

Consult your network administrator on how to reserve a fixed IP address for your CN2600 in the MAC-IP mapping table when using a DHCP Server or BOOTP Server. For most applications, you should assign a fixed IP address to your CN2600.

## **Factory Default IP Address**

The CN2600 is configured with the following default private IP addresses:

#### 192.168.126.254 and 192.168.127.254

Note that IP addresses that begin with "192.168" are referred to as private IP addresses. Devices configured with a private IP address are not directly accessible from a public network. For example, you would not be able to ping a device with a private IP address from an outside Internet connection. If your application requires sending data over a public network, such as the Internet, your CN2600 will need a valid public IP address, which can be leased from a local ISP.

## **Configuration Options**

#### **Terminal Server Search Utility**

You may configure your CN2600 with the bundled NPort Search Utility for Windows. Please refer to Chapter 9 *Software Installation/Configuration*, for details on how to install and use Terminal Server Search Utility.

#### Web Console

You may configure your CN2600 using a standard web browser. Please refer to Chapter 5, *Configuration with the Web console*, for details on how to access and use the CN2600 web console.

#### LCM Console/Front Panel

The CN2600 only gives you the option to configure some settings through the front panel, also known as the LCM (Liquid Crystal Module) console. The LCM console can be configured for read-only or writeable access. Read-only access allows settings to be viewed but not changed. Factory default settings are for writeable access, where configuration is allowed through the LCM console.

#### NOTE

The wide temperature model does not have an LCM Display panel and push buttons. The LCM description below applies only to standard temperature models.

#### ATTENTION

If a password has been enabled for the CN2600 console and the LCM console is configured for writeable status, the LCM console will require you to enter the password before allowing you access. The password will not be required if the LCM console is configured for read-only access.

The **MENU** button activates the main menu. It is also used to cancel a selection and return to a previous menu.

The **UP** and **DOWN** buttons navigate between available options.

The **SEL** button confirms a selection or enters a submenu.

The IP environment (Static, DHCP, PPPoE, etc.) is configured under **Main Menu ( Network setting ( IP config**. The IP address is configured under **Main Menu ( Network setting ( IP address**. After the address has been entered, you will need to restart the CN2600 under **Main Menu ( Save/Restart**.

The following instructions explain how to set the CN2600's IP address through the LCM console:

- 1. Press **MENU** to activate the Main Menu.
- The first line of the display indicates the current menu and should read Main Menu. The second line
  indicates the current selection and should read Server setting. Use the UP and DOWN buttons to
  select Network setting. Press SEL to enter the Network setting menu.
- 3. In the Network setting menu, select IP config. Don't forget to press SEL to confirm your selection.
- 4. In the **IP config** menu, use the **UP** and **DOWN** buttons to select the option that matches your IP environment (static, DHCP, etc.). Press **SEL** to confirm your choice. You may also press **MENU** to cancel your selection and return to the previous submenu.
- You should be back in the Network setting menu. From the Network setting menu, select IP address.
- 6. Use the UP and DOWN buttons to modify the digit currently selected by the blinking cursor. Press SEL to move to the next digit. Continue modifying the IP address until all digits have been entered. If you make a mistake, press MENU to cancel all changes and return to the Network setting menu. You cannot go back one digit.
- Once you have finished modifying the IP address, your changes are saved but not in effect. In order for your changes to take effect, you will need to restart the CN2600. You may view and modify your changes by selecting **IP address** at the **Network setting** menu again.
- Press the menu button to exit out of the Network setting menu and return to the Main Menu. Use the UP and DOWN buttons to select Save/Restart and press SEL. Use the UP and DOWN buttons to select Yes and press SEL to restart.

#### ARP

You may use the ARP (Address Resolution Protocol) command to set up an IP address for your CN2600. The ARP command tells your computer to associate the CN2600's MAC address with an IP address. Afterwards, use Telnet to access the CN2600 and its IP address will be reconfigured.

#### ATTENTION

In order to use the ARP setup method, both your computer and the CN2600 must be connected to the same LAN. Alternatively, you may use a cross-over Ethernet cable to connect the CN2600 directly to your computer's Ethernet card. Before executing the ARP command, your CN2600 must be configured with the factory default IP address (192.168.127.254) and your computer and the CN2600 must be on the same subnet.

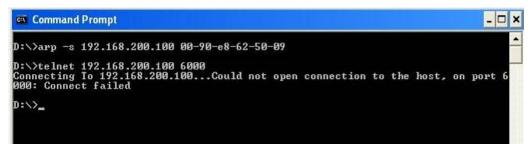

To use ARP to configure the IP address, complete the following:

- 1. Obtain a valid IP address for your CN2600 from your network administrator.
- 2. Obtain your CN2600's MAC address from the label on the bottom panel.
- 3. Execute the arp -s command from your computer's MS-DOS prompt as follows:

**arp -s** *<IP address> <MAC address>* For example,

C:\> arp -s 192.168.200.100 00-90-E8-04-00-11

- Next, execute a special Telnet command by entering the following exactly: telnet 192.168.200.100 6000
- 5. When you enter this command, a **Connect failed** message will appear, as shown below.

 After the CN2600 reboots, its IP address will assigned to the new address and you can reconnect using Telnet to verify that the update was successful.

#### **Telnet Console**

Depending on how your computer and network are configured, you may find it convenient to use network access to set up your CN2600's IP address. This can be done using Telnet.

#### ATTENTION

Figures in this section were taken from the CN2600's Telnet console.

From the Windows desktop, select Start > Run, and then type telnet 192.168.127.254 in the Run window (for LAN 1) or telnet 192.168.126.254 (for LAN 2).

If your IP address is different from the default setting, use your IP address instead. Click **OK**.

| Run           | ?×  |  |  |  |  |
|---------------|---|--|--|--|--|
| <u> </u>      | Type the name of a program, folder, document, or Internet resource, and Windows will open it for you. |  |  |  |  |

10. Press S or use the arrow keys to select System and then press ENTER to restart the CN2600.

#### Serial Console

The CN2600 supports configuration through the serial console, which is the same as the Telnet console but accessed through the RS-232 console port rather than through the network. Once you have entered the serial console, the configuration options and instructions are the same as if you were using the Telnet console.

The following instructions and screenshots show how to enter the serial console using PComm Terminal Emulator, which is available free of charge as part of the PComm Lite suite. You may use a different terminal emulator utility, although your actual screens and procedures may vary slightly from the following instructions.

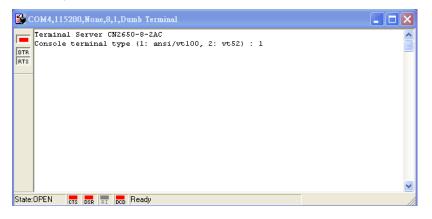

- 1. Use a serial cable to connect the CN2600's serial console port to your computer's male RS-232 serial port.
- 2. From the Windows desktop select Start > All Programs > PComm Lite > Terminal Emulator.
- 3. The PComm Terminal Emulator window should appear. From the **Port Manager** menu, select **Open**, or simply click the **Open icon** as shown below:

 The Property window opens automatically. Select the **Communication Parameter** tab, and then select the appropriate COM port for the connection (COM1 in this example). Configure the baudrate for either 460800, 230400, 115200, 57600, 38400, 19200, or 9600, and then press **OK**.

| Communication Parame |              |         | Ċ |
|----------------------|--------------|---------|---|
| COM Options          |              |         |   |
| Ports :              | COM1         | •       |   |
| Baud Rate :          | 19200        | •       |   |
| Data Bits :          | 8            | -       |   |
| Parity :             | None         | •       |   |
| Stop Bits :          | 1            | -       |   |
| Flow Control         | - Output Sta | ate     | _ |
| T RTS/CTS            | DTR 💽        | ON C OF | F |
|                      | RTS 📀        | ON C OF | F |
|                      |              |         |   |

- 5. From the Property window's Terminal page, select ANSI or VT100 for Terminal Type and click OK.
- Press <Enter> key to bring out the console screen. If the CN2600 has been set up for password protection, you will be prompted to enter the password. After you enter the password, or if password protection was not enabled, you will be prompted to select the terminal mode. Press 1 for ansi/vt100 and then press ENTER.

7. The main menu should come up. Once you are in the console, you may configure the IP address through the **Network** menu item, just as with the Telnet console. Please refer to steps 4 to 11 in the *Telnet Console* section to complete the initial IP configuration.

|            |            |          |        |                           |           |       |      |         |      |   |
|            |            |          |        |                           |           |       |      |         |      |   |
|            |            |          |        |                           |           |       |      |         |      |   |
|            |            |          |        |                           |           |       |      |         |      |   |
|            |            |          |        |                           |           |       |      |         |      | ٨ |
|            |            |          |        |                           |           |       |      |         |      | ~ |
| State:     | OPEN CTS   | DSR RI   | DCD    | Ready                     |           |       |      |         |      |   |

In this chapter, we describe the various operation modes of the CN2600. CN2600 modes are grouped by type of application, such as Device Control or Reverse Terminal. The options include an operation mode that relies on a driver installed on the host computer, and operation modes that rely on TCP/IP socket programming concepts. After selecting the proper operation mode, please refer to Chapter 5, *Configuration with the Web Console*, for detailed information on configuration parameters.

## **Overview**

The CN2600 network-enables traditional serial (RS-232/422/485) devices. The serial device server is a special-purpose computer equipped with a CPU and TCP/IP protocols that can bi-directionally translate data between the serial and Ethernet formats. Your own computer will be able to access, manage, and configure remote facilities and equipment over the Internet from anywhere in the world.

Traditional SCADA and data collection systems rely on serial ports to collect data from various kinds of instruments. Since the CN2600 network-enables instruments equipped with an RS-232, RS-422, or RS-485 communication port, your SCADA and data collection system will be able to access all instruments connected to a standard TCP/IP network, regardless of whether the devices are used locally or at a remote site.

The CN2600 is an external IP-based network device that allows you to expand the number of serial ports for a host computer on demand. As long as your host computer supports the TCP/IP protocol, you will not be limited by the host computer's bus limitation (such as ISA or PCI), nor will you be limited by the absence of drivers for various operating systems.

In addition to providing socket access, the CN2600 also comes with a Real COM/TTY driver that transmits all serial signals intact. This enables you to preserve your existing COM/TTY-based software without needing to invest in additional software.

Three different socket modes are available: TCP Server, TCP Client, and UDP Server/Client. The main difference between the TCP and UDP protocols is that TCP guarantees delivery of data by requiring the recipient to send an acknowledgement to the sender. UDP does not require this type of verification, making it possible to offer faster delivery. UDP also allows unicast or multi-unicast of data to one IP or groups of IP addresses.

The CN2600 also supports console management applications, including Reverse Telnet modes. Reverse terminal modes enable you to connect to a server's console port through an IP network for remote control and/or monitoring of that server.

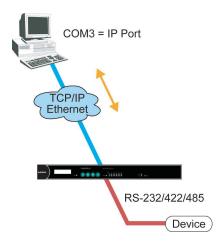

## **Device Control Applications**

For device control applications, the CN2600 offers the following modes: Real COM and RFC2217 mode.

### **Real COM Mode**

The CN2600 comes bundled with Real COM drivers for Windows 98/ME/NT/ 2000/XP/2003/Vista systems and TTY drivers for Linux systems.

In Real COM mode, the bundled drivers are able to establish a transparent connection between a host and a serial device by mapping the serial port on the CN2600 to a local COM/TTY port on the host computer. Real COM mode supports up to 8 simultaneous connections that enable multiple hosts to simultaneously collect data from the same serial device.

One of the major conveniences of using Real COM mode is that it allows you to use software that was written for pure serial communication applications. The Real COM driver intercepts data sent to the host's COM port, packs it into a TCP/IP packet, then redirects it through the host's Ethernet card. At the other end of the connection, the CN2600 accepts the Ethernet frame, unpacks the TCP/IP packet, and then transparently sends the data through the serial port to the attached serial device.

#### ATTENTION

Real COM mode allows several hosts to have access control over the same CN2600. The drivers that come with your CN2600 control host access by checking the host's IP address. Please refer to the Accessible IP List section in Chapter 8, System Management Settings, for more details.

#### RFC2217 Mode

RFC-2217 mode is similar to Real COM mode. That is, a driver is used to establish a transparent connection between a host computer and a serial device by mapping the serial port on the CN2600 to a local COM port on the host computer. RFC2217 defines general COM port control options based on the Telnet protocol. Third party drivers supporting RFC-2217 are widely available on the Internet and can be used to implement Virtual COM mapping to your CN2600 serial port(s).

## **Socket Applications**

For socket applications, the CN2600 offers the following modes: TCP Server, TCP Client and UDP.

#### **TCP Server Mode**

In TCP Server mode, the serial port on the CN2600 is assigned a port number which must not conflict with any other serial port on the CN2600. The host computer initiates contact with the CN2600, establishes the connection, and receives data from the serial device. This operation mode also supports up to 8 simultaneous connections, enabling multiple hosts to collect data from the same serial device at the same time.

As illustrated in the figure, data transmission proceeds as follows:

- 1. The host requests a connection from the CN2600, which is configured for TCP Server mode.
- Once the connection is established, data can be transmitted in both directions between the host and the CN2600.

#### **TCP Client Mode**

In TCP Client mode, the CN2600 can actively establish a TCP connection to a pre-defined host computer when serial data arrives.

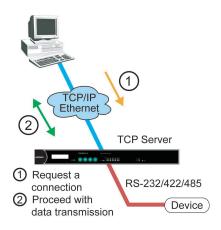

After the data has been transferred, the CN2600 can automatically disconnect from the host computer by using the Inactivity time settings.

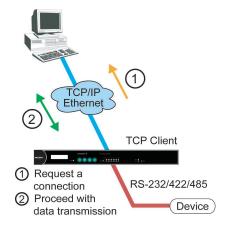

As illustrated in the figure, data transmission proceeds as follows:

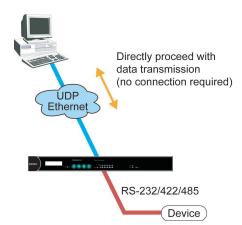

- 1. The CN2600, configured for TCP Client mode, requests a connection from the host.
- Once the connection is established, data can be transmitted in both directions between the host and the CN2600.

#### **UDP Mode**

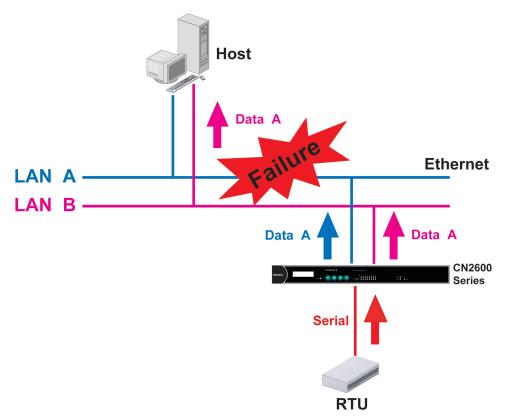

Compared to TCP communication, UDP is faster and more efficient. In UDP mode, you can unicast or multi-unicast data from a serial device to one or multiple host computers and the serial device can receive data from one or multiple host computers. These traits make UDP mode especially suited for message display applications.

## **Redundant COM**

The Redundant COM operation mode can be used to set up a redundant LAN between the serial devices connected to the CN2600's serial ports and the host computer. The redundant structure involves using the CN2600's two LAN ports to set up two independent LANs that connect the CN2600 to the host computer. If either of the two LANs fails, the other LAN will continue transmitting packets between the serial devices and the host, with the packets passing through the CN2600. In fact, one of the biggest advantages of the CN2600's Redundant COM mode is that the "switching time" is zero.

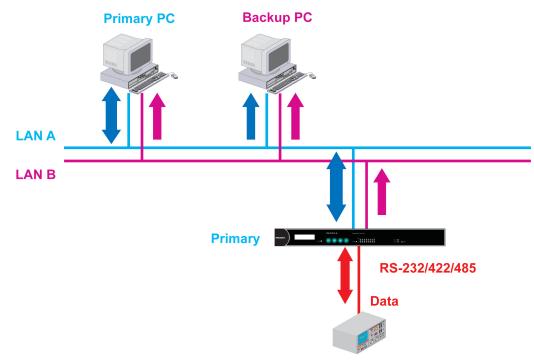

## 

#### ATTENTION

If either LAN gets disconnected, it will take at least 1 minute for the LAN to recover after reconnecting.

If both LANs get disconnected, you will need to re-open your application software's COM port for data to transmit properly.

# Dual-host Redundant Data Acquisition System (DRDAS)

**Remote Terminal Unit (RTU)** 

The DRDAS operation mode provides a highly redundant network structure that takes advantage of the CN2600's dual LAN ports, dual IP addresses, and dual MAC addresses. DRDAS uses a backup PC that is set up to take over when the primary PC fails.

The CN2600's dual-host redundant configuration sends serial data to 4 IP addresses on the network. Users select a Primary IP and 3 Secondary IPs. When the Primary IP fails, the backup IPs take over by using the DRDAS library.

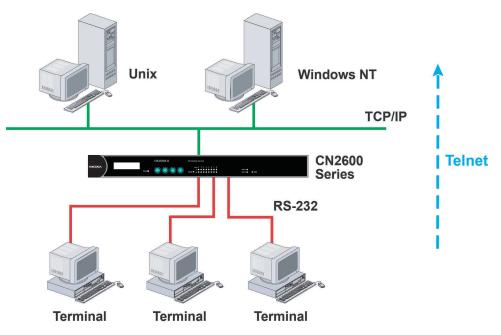

The DRDAS library is used to configure the DRDAS of the CN series. You must use the DRDAS library to designate the primary and secondary hosts. If you need this library, please contact conn.support@moxa.com

With this kind of redundant setup, if one of the secondary IPs tries to send commands to the serial device, the commands are discarded by the CN2600, since only the Primary IP is allowed to conduct bi-directional transmission. The backup IPs are only allowed to receive data from the CN2600.

#### NOTE

The RS-232 connector on the Remote Terminal Unit (RTU) shown above must be set up with an RS-232 to RS-422/485 converter, such as the Moxa TCC-100I, to convert RS-232 signals to RS-485 signals. The connectors on the two CN2600 terminal servers will also need to use converters, such as the Moxa TCC-100I. In this way, users can take advantage of RS-485's multi-drop feature to share data with the secondary CN2600.

## **Terminal Applications**

Terminal applications involve connecting terminals to UNIX or Windows servers over a network. A terminal connects to the appropriately configured serial port the CN2600, and the CN2600 transmits information to and from a UNIX or Windows server over the network through its Ethernet port. You may need to check with your network administrator to determine the appropriate terminal mode. All terminal modes support fast keys as used in many terminal applications.

Please refer to Chapter 4, *Introducing Serial Port Operation Modes*, for detailed information and configuration instructions.

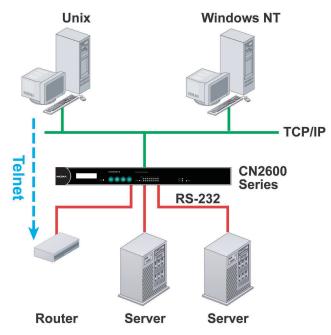

#### **Terminal ASCII Mode**

Terminal ASCII mode can handle up to 8 sessions per port with the ability to switch between sessions on the same terminal. This mode is used for text-based terminals with no file transfer capability or encryption.

#### **Terminal BIN Mode**

Terminal BIN mode allows one session per port and is used for terminal applications that include file transfer features.

## **Reverse Terminal Applications**

Reverse terminal applications are similar to terminal applications in that they involve using the CN2600 to manage the connection between a terminal and a server. The difference is that with reverse terminal applications, the terminal is connected through the network and the server is connected through the serial port, rather than the other way around. In practice, a reverse terminal session typically involves a network administrator telnetting to a device that has a dedicated serial console port used specifically for configuration purposes.

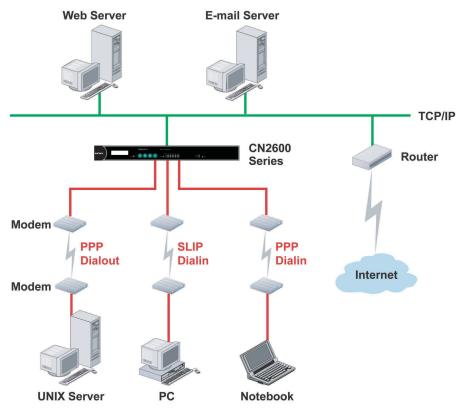

For example, many routers, switches, UPS units, and other devices (including the CN2600) have Console/AUX or COM ports to which a terminal can be physically connected for console management. With the CN2600, the device's console port can be connected to a serial port on the CN2600, allowing a network administrator to telnet to the device remotely through the network. Although modern network equipment generally allows other options for remote configuration through the network, there are situations in which it is necessary or desirable to configure a device by serial console (e.g., for security reasons, when using older-generation equipment, or as a backup configuration method when the network is down).

CN2600 reverse terminal modes allow the use of the CN2600 User Table or a RADIUS server for identity verification purposes. Please refer to the Misc. Network Settings section in Chapter 8, *System Management Settings*, for instructions on setting up the CN2600 User Table.

#### **Reverse Telnet**

Reverse Telnet mode is widely used for device management in telecommunication control rooms. The system waits for a host on the network to initiate a connection. Since TCP Server mode does not assist with conversion of CR/LF commands, reverse terminal applications that require this conversion should use Reverse Telnet mode.

## Dial In/Out Modes

The CN2600 provides dial-in/dial-out access for ISPs and enterprises that need a remote access solution. When a user at a remote site uses a PPP dial-up connection to access the CN2600, the CN2600 plays the role of a dial-up server, but also ensures that the user has legal access to the network by verifying the user's identity with the CN2600 User Table or a RADIUS server. Please refer to the Misc. Network Settings section in Chapter 8, *System Management Settings*, for instructions on setting up the CN2600 User Table.

The CN2600 supports PPP, SLIP, and Terminal modes for dial-in/dial-out access. Regardless of which operating system is used, you will always be able to use standard PPP dial-up to establish a connection. The CN2600 can also act as a router to connect serial ports to a WAN connection. Routing protocols (including static, RIP I, and RIP II) can be adjusted to route different WAN connections.

Please refer to Chapter 5, *Configuration with Web Console*, for detailed information and configuration instructions.

## **Disabled Mode**

You can disable any port on the CN2600 by setting the operation mode to **Disabled**.

## 5. Configuration with the Web Console

The web console is the most user-friendly method available to configure the CN2600. With a standard web browser, you have easy and intuitive access to all settings and options. In this chapter, we introduce the web console and go through the basic configuration options. The same configuration options are also available through the Telnet and serial console.

## **Using Your Web Browser**

#### **Browser Cookie Settings**

Verify that cookies are enabled for your browser. If the cookies are disabled, you will not be able to use the web console. (Cookies are only used for password transmission.)

1. For Internet Explorer, enable cookies by selecting Internet Options from the Tools menu:

| Internet Options   | × |
|--|---|
| General Security Privacy Content Connections Programs Advanced   | 1 |
| Home page You can change which page to use for your home page. Address: m/isapi/redir.dll?prd=ie&pver=6&ar=msnhome   |   |
| Use <u>C</u> urrent Use <u>D</u> efault Use <u>B</u> lank  |   |
| Temporary Internet files         Pages you view on the Internet are stored in a special folder for quick viewing later.         Delete Cookjes         Delete Eiles      |   |
| History<br>The History folder contains links to pages you've visited, for<br>quick access to recently viewed pages.<br>Days to keep pages in history: 20 + Clear History |   |
| Colors Fonts Languages Accessibility   |   |
| OK Cancel Apply  |   |

 Select the **Privacy** tab. There are six levels of privacy setting: Block All Cookies, High, Medium High, Medium, Low, and Accept All Cookies. Users must select **Medium High** (as the image shows) or below to access the CN2600 web console.

| Setti | Ň                                    | love the s                                  | lider to select a  | privacy setting for th  | ne Internet       |

#### ATTENTION

If you are not using Internet Explorer, cookies are usually enabled through a web browser setting such as "allow cookies that are stored on your computer" or "allow per-session cookies."

#### **Trusted Site Settings**

For Windows 2003 users, you may need to add the CN2600's IP address to your browser's list of trusted sites.

1. If you see the following window while attempting to view the web console, click on Add... to modify the list of trusted sites:

You may also directly access the list of trusted sites through **Internet Options** in the **Tools** menu of Internet Explorer. Select the **Security** tab, then click on the **Trusted Sites icon** and on the **Sites...** button:

| Internet Options  |  |  |  |  |
|---|--|--|--|--|
| General Security Privacy Content Connections Programs Advanced  |  |  |  |  |
| Select a Web content zone to specify its security settings.   |  |  |  |  |
|   |  |  |  |  |
| Internet Local intranet Trusted sites Restricted sites  |  |  |  |  |
| Trusted sites         This zone contains Web sites that you trust not to damage your computer or data.         Security level for this zone |  |  |  |  |
| Custom<br>Custom settings.<br>- To change the settings, click Custom Level.<br>- To use the recommended settings, click Default Level.      |  |  |  |  |
| Dustom Level         Default Level  |  |  |  |  |
| OK Cancel Apply   |  |  |  |  |

2. In either case, the window below should appear, showing the list of sites that you have configured Internet Explorer to trust. Add the IP address of your CN2600 here (the factory default LAN1 IP address is 192.168.127.254 and default LAN2 IP address is 192.168.126.254.)

| Trusted sites  | ? ×            |  |  |  |  |
|--|----------------|--|--|--|--|
| You can add and remove Web sites from this zo<br>in this zone will use the zone's security settings.   |                |  |  |  |  |
| Add this Web site to the zone:   | Add            |  |  |  |  |
| http://192.168.127.254   | <u></u>        |  |  |  |  |
| <u>W</u> eb sites:   |                |  |  |  |  |
| http://*.update.microsoft.com<br>https://*.update.microsoft.com<br>http://*.windowsupdate.microsoft.com<br>http://*.windowsupdate.microsoft.com<br>http://go.microsoft.com | <u>R</u> emove |  |  |  |  |
| Require server verification (https:) for all sites in this zone  |                |  |  |  |  |
|  |                |  |  |  |  |
|  | ⊆lose          |  |  |  |  |

After adding the CN2600's IP address as a trusted site, you should be able to view the web console by entering the CN2600's IP address in your browser's address bar.

#### **Opening the Web Console**

Open your web browser and enter **192.168.127.254** in the website address line. This is the default IP address for the CN2600–if a new address has been assigned, enter the new address instead. Press **ENTER** to load the page.

#### ATTENTION

The examples and figures in this chapter use the CN2600 factory default IP address of 192.168.127.254. If you have assigned a different IP address to your CN2600, be sure to adjust accordingly when following these directions. Please refer to Chapter 3, Initial IP Address Configuration, for details on how to configure the IP address.

1. Enter the console password if prompted. (This will not apply if you did not enable password protection for your CN2600.) The password will be transmitted with MD5 encryption over the Ethernet.

| мохл |   |  |
|------|---|--|
|      | Web Console Login Username : admin Password : Login |  |

#### ATTENTION

If you forget your password, the ONLY way to configure the CN2600 is by using the reset button to reset all settings and load the factory defaults. If you have disabled the reset button in your CN2600 configuration, you may still use it to load the factory defaults within the first 60 seconds that the CN2600 is powered on.

Remember to back up your configuration by exporting it to a file. Your configuration can be easily restored by importing the file to the CN2600. This will save time if you have forgotten the password and need to reload the factory defaults.

2. The CN2600's web console will appear.

## Web Console Navigation

In the CN2600 web console, the left panel is the navigation panel and contains an expandable menu tree for navigating among the various settings and categories. When you click on a menu item in the navigation panel, the main window will display the corresponding options for that item. Configuration changes can then be made in the main window. For example, if you click on **Basic Settings** in the navigation panel, the main window will show a page of basic settings that you can configure.

You must click on the **Submit** button to keep your configuration changes. The **Submit** button will be located at the bottom of every page that has configurable settings. If you navigate to another page without clicking the Submit button, your settings will not be retained.

**Changes will not take effect until they are saved and the NPort is restarted!** You may complete this in one step by clicking on the **Save/Restart** option after you submit a change. If you need to make several changes before restarting, you may save your changes without restarting by selecting **Save Configuration** in the navigation panel. If you restart the CN2600 without saving your configuration, the CN2600 will discard all submitted changes.

## **Basic Settings**

You may access Basic Settings in the navigation panel.

**Server name**: This is an optional free text field for your own use; it does not affect operation of the CN2600. It can be used to help differentiate one CN2600 server from another.

**Server location**: This is an optional free text field for your own use; it does not affect operation of the CN2600. It is useful for assigning or describing the location of a CN2600. In a network environment of multiple servers, this can be a valuable aid when performing maintenance.

#### **Time Settings**

The CN2600 has a built-in Real-Time Clock for time calibration functions. Functions such as Auto Warning Email or SNMP Trap can add real-time information to messages.

Before making any adjustments to the time, first select the correct time zone and submit the change. The console will display the real time according to the time zone. To modify the real time clock, click on **Modify** next to the **Local time** field. Once you submit the new time, the CN2600's firmware will modify the GMT time according to your time zone and local time settings.

#### ATTENTION

There is a risk of explosion if the real-time clock battery is replaced with the wrong type!

The CN2600's real time clock is powered by a lithium battery. We strongly recommend that you do not attempt replacement of the lithium battery without help from a qualified Moxa support engineer. If you need to change the battery, please contact the Moxa RMA service team.

**Time zone** (default=GMT Greenwich Mean Time): This field shows the currently selected time zone and allows you to select a different time zone.

**Local time**: This field shows the time that you last opened or refreshed the browser. To set the local time for the CN2600, click on the **Modify...** button, then submit your changes in the screen as shown below.

| 🚰 Time Settings               |  |
|-------------------------------|--|
| Modify time settings          |  |
| Date(yy:mm:dd) Time(hh:mm:ss) |  |
| 2006 / 5 / 10 3 : 18 : 48     |  |
| Submit Close                  |  |
|                               |  |
|                               |  |

**Time server**: The CN2600 uses SNTP (RFC-1769) for auto time calibration. You may enter a time server IP address or domain name in this optional field. Once the CN2600 is configured with the correct time server address, it will request time information from the time server every 10 minutes.

## **Network Settings**

#### **Basic Network Settings**

|   | WINS server                                  |  |

You can access **Basic Network Settings** by expanding the **Network Settings** item in the navigation panel. Basic Network Settings is where you assign the CN2600's IP address, netmask, Gateway, and other IP parameters.

#### NOTE

You must assign a valid IP address to your CN2600 before it will work in your network environment. Your network system administrator should provide you with a unique IP address and related settings for your network. First-time users can refer to Chapter 3, Initial IP Address Configuration, for more information.

| Option     | Description   |
|------------|---|
| Static     | User-defined IP address, netmask, gateway.  |
| DHCP       | DHCP server-assigned IP address, netmask, gateway, DNS, and time server           |
| DHCP/BOOTP | DHCP server-assigned IP address, netmask, gateway, DNS, and time server, or BOOTP |
|            | server-assigned IP address (if the DHCP server does not respond)                  |
| BOOTP      | BOOTP server-assigned IP address  |
| PPPoE      | PPP over Ethernet, remote ISP-assigned IP address                                 |

**IP configuration** (default=Static): You can choose from four possible IP configuration modes.

**IP Address** (LAN1 default = 192.168.127.254; LAN2 default = 192.168.126.254): Enter the IP address that will be assigned to your CN2600. All ports on the CN2600 will share this IP address. An IP address is a number assigned to a network device (such as a computer) as a permanent address on the network. Computers use the IP address to identify and talk to each other over the network. Choose a proper IP address that is unique and valid in your network environment.

**Netmask** (default=255.255.255.0): Enter the subnet mask. A subnet mask represents all of the network hosts at one geographic location, in one building, or on the same local area network. When a packet is sent out over the network, the CN2600 will use the subnet mask to check whether the desired TCP/IP host specified in the packet is on the local network segment. If the address is on the same network segment as the CN2600, a connection is established directly from the CN2600. Otherwise, the connection is established through the given default gateway.

**Gateway**: Enter the IP address of the gateway if applicable. A gateway is a network computer that acts as an entrance to another network. Usually, the computers that control traffic within the network or at the local Internet service provider are gateway nodes. The CN2600 needs to know the IP address of the default gateway computer in order to communicate with the hosts outside the local network environment. For correct gateway IP address information, consult the network administrator.

#### ATTENTION

In dynamic IP environments, the firmware will try to get the network settings from the DHCP or BOOTP server 3 times every 30 seconds until network settings are assigned by the DHCP or BOOTP server. The first try times out after 1 second, the second after 3 seconds, and the third after 5 seconds.

If the DHCP/BOOTP server is unavailable, the firmware will use the default IP address (192.168.127.254), netmask, and gateway settings.

**DNS server 1**: This is an optional field. If your network has access to a DNS server, you may enter the DNS server's IP address in this field. This allows the CN2600 to use domain names instead of IP addresses to access hosts.

Domain Name System (DNS) is the way that Internet domain names are identified and translated into IP addresses. A domain name is an alphanumeric name, such as www.moxa.com, that it is usually easier to remember than the numeric IP address. A DNS server is a host that translates this kind of text-based domain name into the actual IP address used to establish a TCP/IP connection. When the user wants to visit a particular website, the user's computer sends the domain name (e.g., www.moxa.com) to a DNS server to request that website's numeric IP address. When the IP address is received from the DNS server, the user's computer uses that information to connect to the website's web server.

The CN2600 will play the role of a DNS client, in the sense that it will actively query the DNS server for the IP address associated with a particular domain name. The following functions on the CN2600 web console support the use of domain names in place of IP addresses: Time Server, Destination IP Address (in TCP Client mode), Mail Server, SNMP Trap Server, Primary/Secondary Host Address (in Terminal mode), RADIUS Server and SMTP Server.

**DNS server 2**: This is an optional field. The IP address of another DNS server may be entered in this field for times when DNS server 1 is unavailable.

**PPPoE user account** and **PPPoE password**: For dynamic broadband networks such as xDSL or cable modem, users must enter the username and password that they received from their ISP to establish network connection. If a serial port on the CN2600 will be using PPPoE, enter the account name and password in these fields.

WINS function (default=enable): Enable or disable the WINS (Windows Internet Naming Service) server.

**WINS server**: If a WINS Server is connected to the network, enter the WINS Server's IP address in this field. TCP/IP uses IP addresses to identify hosts, but users often use symbolic names, such as computer names. The WINS Server, which uses NetBIOS over TCP/IP, contains a dynamic database to map computer names to IP addresses.

**LAN speed** (default=Auto): You may configure the network speed for the built-in Ethernet connection on the CN2600. IEEE802.3 Ethernet supports auto negotiation of transfer speed. However, some switches/hubs require that the communication speed be fixed at 100Mbps or 10Mbps.

### **Advanced Network Settings**

You can access **Advanced Network Settings** by expanding the Network Settings item in the navigation panel. Advanced Network Settings is where the routing protocol and gratuitous ARP are configured.

| MOXA  | www.moxa.com  |   |
|---|---|---|
| Main Menu<br>Overview<br>Basic Settings<br>Basic Network Settings<br>Advanced Network Settings<br>Serial Port Settings<br>System Management<br>System Monitoring<br>Save Configuration<br>Restart | Network Settings - Advanced<br>Routing protocol<br>Gratuitous ARP | ≫ Total Solution for Industrial Device Networking None ♥ □Enabled Send period 300 (10 - 1000 sec) |

#### What is RIP?

RIP (Routing Information Protocol) is a protocol used to manage routing information within a self-contained network, such as a corporate LAN (Local Area Network) or an interconnected group of such LANs.

By using RIP, a gateway host with a router can send its entire routing table, which lists all the other hosts it knows about, to its closest neighbor host every 30 seconds. The neighbor host in turn will pass this information on to its closest neighbor, and so on, until all hosts within the network have the same routing path information. This state is known as network convergence. RIP uses a hop count as a way of determining network distance. (Other protocols use more sophisticated algorithms that also include timing.) After receiving a packet headed for a specific destination, a network host with a router uses the routing table information to determine the next host to route the packet to.

RIP is considered an effective solution for small homogeneous networks. For larger, more complicated networks, transmitting the entire routing table every 30 seconds can bog down the network with a lot of extra traffic.

RIP 2 is an extension of RIP. Its purpose is to expand the amount of useful information contained in RIP packets, and to add security elements. RIP 2 has become the standard version of RIP, and the original RIP is no longer used.

Routing Protocol: You may select which routing protocol, if any, your network will employ.

**Gratuitous ARP**: In some applications, you may need the CN2600 to send broadcast packets to update the ARP table on the server. If you enable this function and set the send period, the CN2600 will send periodically send broadcast packets at the specified time interval.

## **Configuring the Route Table**

You can access the **Route Table** by expanding **System Management** and then **Misc. Network Settings** in the navigation panel. The route table is where you configure how the CN2600 will connect to an outside network.

You are allowed up to 32 entries in the route table. For each entry, you must provide information on the gateway, destination, netmask, metric hops, and interface.

**Gateway**: This is the IP address of the next-hop router.

Destination: This is the host's IP address or the network address of the route's destination.

Netmask: This is the destination network's netmask.

**Metric**: Enter the number of hops from the source to the destination allow the CN2600 to prioritize the routing of data packets if more than one router is available.

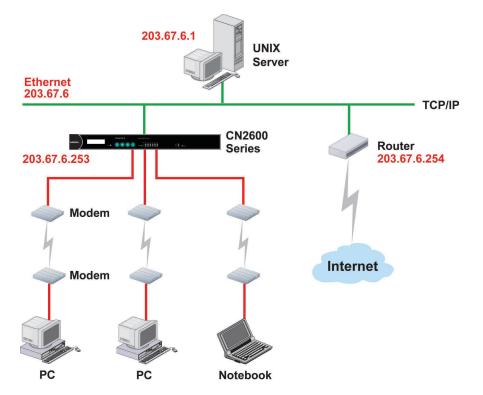

Iface: This is the network interface to which the packet must be sent.

#### ATTENTION

When a serial port is configured for PPP/SLIP, the Iface field must be set to that serial port for proper communication.

#### **Configuring Routes to the Internet**

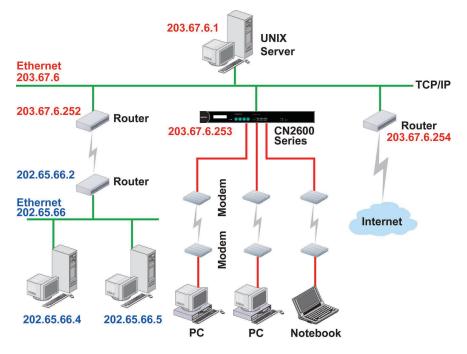

In this example, the Notebook PC dials into the CN2600 to request a connection to the Internet host at **210.48.96.9**, which is not on the local network **203.67.6**.*xxx*. This causes the CN2600 to act as a router and send the datagram to the default next-hop router, **203.67.6.254**. In this case, we should add the gateway IP address of **203.67.6.254** to the routing table to handle hops to **210.48.96.9**.

| ain Menu                             | Route | e Table      |             |                 |        |        |

Generally, connections to the Internet are handled by assigning a gateway server in the network settings rather than through the route table.

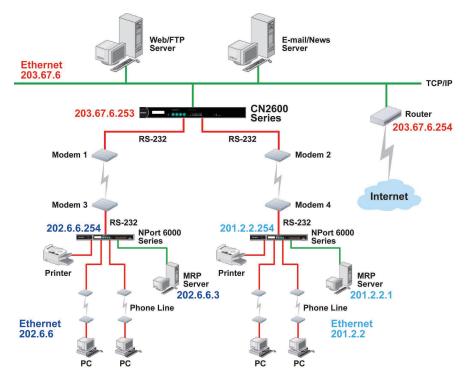

#### **Configuring Routes to the Intranet**

In this example, dial-in users can make requests to Intranet hosts **202.65.66.4** or **202.65.66.5**, which are on network **202.65.66**.*xxx* (located outside network **203.67.6**.*xxx*). You will need to add a route entry for the next-hop router, **203.67.6.252** that delivers requests to network **202.65.66**.*xxx*. The metric hop in this case is 2 route hops.

#### **Configuring Multiple-Point Routes**

For multi-location enterprises, CN2600 servers can be placed in different branch offices and used as both multi-point routers and as remote access servers. When hosts (e.g., the Web/FTP and E-mail/News servers shown in the figure) send requests to hosts on another network, such as **202.6.6**.*xxx* or **201.2.2**.*xxx*, the corresponding CN2600 delivers the request to the another CN2600 on the remote end, **202.6.6.254** or **201.2.2.254**, as the next-hop router..

For this example, assume that Modem 1 is connected to serial port 1, Modem 2 is connected to serial port 2, and PPP source and destination IP addresses of modems 1, 2, 3, and 4 are as follows:

|         | Source IP    | Destination IP |         | Source IP   | Destination IP |
|---------|--------------|----------------|---------|-------------|----------------|
| Modem 1 | 203.67.6.250 | 202.6.6.250    | Modem 3 | 202.6.6.250 | 203.67.6.250   |
| Modem 2 | 203.67.6.249 | 201.2.2.249    | Modem 4 | 201.2.2.249 | 203.67.6.249   |

In this case, you will need to add two entries to the routing table, as shown in the following figure.

# 6. Configuring Serial Port Operation Modes

In this chapter, we explain how to configure the individual serial port modes.

## **Port Setting Basics**

Each serial port on the CN2600 can be configured independently. To configure the operation mode and settings for a port, expand **Serial Port Settings** in the navigation panel, then expand the port that you would like to configure. Individual port settings are grouped into four categories in the navigation panel: Operation Modes, Communication Parameters, Data Buffering/Log, and Modem Settings.

| <ul> <li>Port 4</li> <li>Port 5</li> <li>Port 6</li> <li>Port 7</li> <li>Port 8</li> <li>Velcome Message</li> <li>System Management</li> <li>System Monitorina</li> </ul> | Data Packing<br>Packet length<br>Delimiter 1<br>Delimiter 2<br>Delimiter process<br>Force transmit        | DTR (0 - 1024)<br>0 ((0 - 1024)<br>00 (Hex) Enable<br>00 (Hex) Enable<br>Do Nothing (Processed only when Packing length is 0)<br>0 (0 - 65535 ms) |
| System Monitoring     Save Configuration     Restart  | Apply the above settings to   |   |

Select **Operation Modes** in the navigation panel to select and configure the mode for each serial port. For CN2600 models with 2 or more serial ports, you may use the checkboxes at the bottom of the window to apply the settings to one or more ports.

**Application**: Select an application for the serial port from among the choices. Your application will determine the modes that are available.

**Mode**: Once you have chosen an application, select the mode. The available configuration settings will vary depending on the mode that you have selected.

# **Device Control Applications**

## **Real COM Mode**

Multiple hosts' Real COM drivers open the port at the same time, the COM driver only provides a pure data tunnel—no control ability. The serial port parameters will use firmware settings instead of depending on your application program (AP).

Application software that is based on the COM driver will receive a driver response of "success" when the software uses any of the Win32 API functions. The firmware will only send data back to the driver on the host.

Data will be sent first-in-first-out when data comes into the CN2600 from the Ethernet interface.

### ATTENTION

When Max connection is greater than 1, the CN2600 will use a multi connection application (i.e., 2 to 8 hosts are allowed access to the port at the same time). When using a multi connection application, the CN2600 will use the serial communication parameters as defined here in the web console, and all hosts connected to the port must use identical serial settings. If one of the hosts opens the COM port with different serial settings, data will not be transmitted properly.

**Ignore jammed IP** (default=No): This option determines how the port will proceed if multiple hosts are connected and one or more of the hosts stops responding as the port is transmitting data. If you select **No**, the port will wait until the data has been transmitted successfully to all hosts before transmitting the next group of data. If you select **Yes**, the port will ignore the host that stopped responding and continue data transmission to the other hosts.

**Allow driver control** (default=No): This option determines how the port will proceed if driver control commands are received from multiple hosts that are connected to the port. If **No** is selected, driver control commands will be ignored. If **Yes** is selected, control commands will be accepted, with the most recent command received taking precedence.

**Connection goes down** (default=always high): You can configure what happens to the RTS and DTR signals when the Ethernet connection goes down. For some applications, serial devices need to know the Ethernet link status through RTS or DTR signals sent through the serial port. Use **goes low** if you want the RTS and DTR signal to change their state to low when the Ethernet connection goes down. Use **always** high if you do not want the Ethernet connection status to affect the RTS or DTR signals.

**Packet length** (default=0): The Packet length setting refers to the maximum amount of data that is allowed to accumulate in the serial port buffer before sending. At the default of 0 for packet length, no maximum amount is specified and data in the buffer will be sent as specified by the delimiter settings or when the buffer is full. When a packet length between 1 and 1024 bytes is specified, data in the buffer will be sent as soon it reaches the specified length.

**Delimiter 1 and Delimiter 2** (default=None): When Delimiter 1 is enabled, the serial port will clear the buffer and send the data to the Ethernet port when a specific character, entered in hex format, is received. A second delimiter character may be enabled and specified in the Delimiter 2 field, so that both characters act as the delimiter to control when data should be sent.

#### ATTENTION

In order to enable a delimiter, packet length must be set to 0. Delimiter 2 should only be enabled in conjunction with Delimiter 1 and never on its own; otherwise there may be data errors. Even when a delimiter is enabled, the CN2600 will still pack and send the data when the amount of data exceeds 1 KB.

**Delimiter process** (default=Do Nothing): The Delimiter process field determines how the data is handled when a delimiter is received. Delimiter 1 must be enabled for this field to have effect. If Delimiters 1 and 2 are both enabled, both characters must be received for the delimiter process to take place.

- Do Nothing: Data in the buffer will be transmitted when the delimiter is received.
- Delimiter + 1: Data in the buffer will be transmitted after 1 additional byte is received following the delimiter.
- Delimiter + 2: Data in the buffer will be transmitted after 2 additional bytes are received following the delimiter.
- Strip Delimiter: Data in the buffer is first stripped of the delimiter before being transmitted.

**Force transmit** (default=0 ms): This parameter defines how large a gap in serial communication the CN2600 will allow before packing the serial data in its internal buffer for network transmission.

As data is received through the serial port, it is stored by the CN2600 in the internal buffer. The CN2600 transmits data stored in the buffer via TCP/IP, but only when the internal buffer is full or as specified by the force transmit time. When set to 0, the force transmit time is disabled, and transmission is determined solely by the data in the internal buffer. At 1 to 65535, the TCP/IP protocol software will pack the serial data received after there is a gap in serial communication that exceeds the specified force transmit time.

The optimal force transmit time depends on your application, but it must be at least larger than one character interval within the specified baudrate. For example, assume that the serial port is set to 1200 bps, 8 data bits, 1 stop bit, and no parity. In this case, the total number of bits needed to send a character is 10 bits, and the time required to transfer one character is

(10 (bits) / 1200 (bits/s)) ( 1000 (ms/s) = 8.3 ms.

Therefore, you should set the force transmit time to be larger than 8.3 ms, so in this case, it must be greater than or equal to 10 ms.

If it is necessary to send a series of characters in the same packet, the serial device will need to send that series of characters within the specified force transmit time, and the total length of data must be less than or equal to the CN2600's internal buffer size (1 KB per port).

**TCP alive check time** (default=7 min): This field specifies how long the CN2600 will wait for a response to "keep alive" packets before closing the TCP connection. The CN2600 checks connection status by sending periodic "keep alive" packets. If the remote host does not respond to the packet within the time specified in this field, the CN2600 will force the existing TCP connection to close. For socket and device control modes, the CN2600 will listen for another TCP connection from another host after closing the connection. If **TCP alive check time** is set to **0**, the TCP connection will remain open even if there is no response to the "keep alive" packets.

**TCP port** (default=4001): This is the TCP port number assignment for the serial port on the CN2600. It is the port number that the serial port uses to listen to connections, and that other devices must use to contact the serial port. To avoid conflicts with well known TCP ports, the default is set to 4001.

**Packet length** (default=0): The Packet length setting refers to the maximum amount of data that is allowed to accumulate in the serial port buffer before sending. At the default of 0 for packet length, no maximum amount is specified and data in the buffer will be sent as specified by the delimiter settings or when the buffer is full. When a packet length between 1 and 1024 bytes is specified, data in the buffer will be sent as soon it reaches the specified length.

**Delimiter 1 and Delimiter 2** (default=None): When Delimiter 1 is enabled, the serial port will clear the buffer and send the data to the Ethernet port when a specific character, entered in hex format, is received. A second delimiter character may be enabled and specified in the Delimiter 2 field, so that both characters act as the delimiter to indicate when data should be sent.

#### ATTENTION

In order to enable a delimiter, packet length must be set to 0. Delimiter 2 should only be enabled in conjunction with Delimiter 1 and never on its own; otherwise there may be data errors. Even when a delimiter is enabled, the CN2600 will still pack and send the data when the amount of data exceeds 1 KB.

**Delimiter process** (default=Do Nothing): The Delimiter process field determines how the data is handled when a delimiter is received. Delimiter 1 must be enabled for this field to have effect. If Delimiters 1 and 2 are both enabled, both characters must be received for the delimiter process to take place.

- Do Nothing: Data in the buffer will be transmitted when the delimiter is received.
- Delimiter + 1: Data in the buffer will be transmitted after 1 additional byte is received following the delimiter.
- Delimiter + 2: Data in the buffer will be transmitted after 2 additional bytes are received following the delimiter.
- Strip Delimiter: Data in the buffer is first stripped of the delimiter before being transmitted.

**Force transmit** (default=0 ms): This parameter defines how large a gap in serial communication the CN2600 will allow before packing the serial data in its internal buffer for network transmission.

As data is received through the serial port, it is stored by the CN2600 in the internal buffer. The CN2600 transmits data stored in the buffer via TCP/IP, but only when the internal buffer is full or as specified by the force transmit time. When set to 0, the force transmit time is disabled, and transmission is determined solely by the data in the internal buffer. At 1 to 65535, the TCP/IP protocol software will pack the serial data received after there is a gap in serial communication that exceeds the specified force transmit time.

The optimal force transmit time depends on your application, but it must be at least larger than one character interval within the specified baudrate. For example, assume that the serial port is set to 1200 bps, 8 data bits, 1 stop bit, and no parity. In this case, the total number of bits needed to send a character is 10 bits, and the time required to transfer one character is

(10 (bits) / 1200 (bits/s)) ( 1000 (ms/s) = 8.3 ms.

Therefore, you should set the force transmit time to be larger than 8.3 ms, so in this case, it must be greater than or equal to 10 ms.

If it is necessary to send a series of characters in the same packet, the serial device will need to send that series of characters within the specified force transmit time, and the total length of data must be less than or equal to the CN2600's internal buffer size (1 KB per port).

## **Socket Applications**

**TCP alive check time** (default=7 min): This field specifies how long the CN2600 will wait for a response to "keep alive" packets before closing the TCP connection. The CN2600 checks connection status by sending periodic "keep alive" packets. If the remote host does not respond to the packet within the time specified in this field, the CN2600 will force the existing TCP connection to close. For socket and device control modes, the CN2600 will listen for another TCP connection from another host after closing the connection. If **TCP alive check time** is set to **0**, the TCP connection will remain open even if there is no response to the "keep alive" packets.

**Inactivity time** (default=0 ms): This field specifies how long the CN2600 will wait for incoming and outgoing data through the serial port before closing the TCP connection. The TCP connection is closed if there is no incoming or outgoing data through the serial port for the specified **Inactivity time**. If this field is set to **0**, the TCP connection is kept active until a connection close request is received.

#### ATTENTION

If used, the Inactivity time setting should be greater than the Force transmit time. To prevent the unintended loss of data due to the session being disconnected, it is highly recommended that this value is set large enough so that the intended data transfer is completed.

**Max connection** (default=1): This field is used if you need to receive data from different hosts simultaneously. When set to 1, only a single host may open the TCP connection to the serial port. When set to 2 or greater, up to the specified number of hosts may open this port at the same time. When multiple hosts establish a TCP connection to the serial port at the same time, the CN2600 will duplicate the serial data and transmit it to all the hosts. Ethernet data is sent on a first-in first-out basis to the serial port when data comes into the CN2600 from the Ethernet interface.

**Ignore jammed IP** (default=No): This option determines how the port will proceed if multiple hosts are connected and one or more of the hosts stops responding as the port is transmitting data. If you select **No**, the port will wait until the data has been transmitted successfully to all hosts before transmitting the next group of data. If you select **Yes**, the port will ignore the host that stopped responding and continue data transmission to the other hosts.

**Allow driver control** (default=No): This option determines how the port will proceed if driver control commands are received from multiple hosts that are connected to the port. If **No** is selected, driver control commands will be ignored. If **Yes** is selected, control commands will be accepted, with the most recent command received taking precedence.

**TCP port** (default=4001): This is the TCP port number assignment for the serial port on the CN2600. It is the port number that the serial port uses to listen to connections, and that other devices must use to contact the serial port. To avoid conflicts with well known TCP ports, the default is set to 4001.

**Command port** (default=966): The Command port is the TCP port for listening to SSDK commands from the host. In order to prevent a TCP port conflict with other applications, the user can set the Command port to another port if needed.

**Packet length** (default=0): The Packet length setting refers to the maximum amount of data that is allowed to accumulate in the serial port buffer before sending. At the default of 0 for packet length, no maximum amount is specified and data in the buffer will be sent as specified by the delimiter settings or when the buffer is full. When a packet length between 1 and 1024 bytes is specified, data in the buffer will be sent as soon it reaches the specified length.

**Delimiter 1 and Delimiter 2** (default=None): When Delimiter 1 is enabled, the serial port will clear the buffer and send the data to the Ethernet port when a specific character, entered in hex format, is received. A second delimiter character may be enabled and specified in the Delimiter 2 field, so that both characters act as the delimiter to indicate when data should be sent.

#### ATTENTION

In order to enable a delimiter, packet length must be set to 0. Delimiter 2 should only be enabled in conjunction with Delimiter 1 and never on its own; otherwise there may be data errors. Even when a delimiter is enabled, the CN2600 will still pack and send the data when the amount of data exceeds 1 KB.

**Delimiter process** (default=Do Nothing): The Delimiter process field determines how the data is handled when a delimiter is received. Delimiter 1 must be enabled for this field to have effect. If Delimiters 1 and 2 are both enabled, both characters must be received for the delimiter process to take place.

- Do Nothing: Data in the buffer will be transmitted when the delimiter is received.
- Delimiter + 1: Data in the buffer will be transmitted after 1 additional byte is received following the delimiter.
- Delimiter + 2: Data in the buffer will be transmitted after 2 additional bytes are received following the delimiter.
- Strip Delimiter: Data in the buffer is first stripped of the delimiter before being transmitted.

**Force transmit** (default=0 ms): This parameter defines how large a gap in serial communication the CN2600 will allow before packing the serial data in its internal buffer for network transmission.

As data is received through the serial port, it is stored by the CN2600 in the internal buffer. The CN2600 transmits data stored in the buffer via TCP/IP, but only when the internal buffer is full or as specified by the force transmit time. When set to 0, the force transmit time is disabled, and transmission is determined solely by the data in the internal buffer. At 1 to 65535, the TCP/IP protocol software will pack the serial data received after there is a gap in serial communication that exceeds the specified force transmit time.

The optimal force transmit time depends on your application, but it must be at least larger than one character interval within the specified baudrate. For example, assume that the serial port is set to 1200 bps, 8 data bits, 1 stop bit, and no parity. In this case, the total number of bits needed to send a character is 10 bits, and the time required to transfer one character is

(10 (bits) / 1200 (bits/s)) ( 1000 (ms/s) = 8.3 ms.

Therefore, you should set the force transmit time to be larger than 8.3 ms, so in this case, it must be greater than or equal to 10 ms.

If it is necessary to send a series of characters in the same packet, the serial device will need to send that series of characters within the specified force transmit time, and the total length of data must be less than or equal to the CN2600's internal buffer size (1 KB per port).

**TCP alive check time** (default=7 min): This field specifies how long the CN2600 will wait for a response to "keep alive" packets before closing the TCP connection. The CN2600 checks connection status by sending periodic "keep alive" packets. If the remote host does not respond to the packet within the time specified in this field, the CN2600 will force the existing TCP connection to close. For socket and device control modes, the CN2600 will listen for another TCP connection from another host after closing the connection. If **TCP alive check time** is set to **0**, the TCP connection will remain open even if there is no response to the "keep alive" packets.

**Inactivity time** (default=0 ms): This field specifies how long the CN2600 will wait for incoming and outgoing data through the serial port before closing the TCP connection. The TCP connection is closed if there is no incoming or outgoing data through the serial port for the specified **Inactivity time**. If this field is set to **0**, the TCP connection is kept active until a connection close request is received.

#### ATTENTION

Inactivity time should at least be set larger than that of Force transmit time. To prevent the unintended loss of data due to the session being disconnected, it is highly recommended that this value is set large enough so that the intended data transfer is completed.

#### ATTENTION

Inactivity time is ONLY active when Connection Control (see below) is set to Any character/Inactivity time.

**Ignore jammed IP** (default=No): This option determines how the port will proceed if multiple hosts are connected and one or more of the hosts stops responding as the port is transmitting data. If you select **No**, the port will wait until the data has been transmitted successfully to all hosts before transmitting the next group of data. If you select **Yes**, the port will ignore the host that stopped responding and continue data transmission to the other hosts.

**Destination address 1** through **4** (default=None): Specifying an IP address allows the CN2600 to connect actively to the remote host. At least one destination must be provided.

**TCP port** (default=4001): This is the TCP port number assignment for the serial port on the CN2600. It is the port number that the serial port uses to listen to connections, and that other devices must use to contact the serial port. To avoid conflicts with well known TCP ports, the default is set to 4001.

#### ATTENTION

Up to 4 connections can be established between the CN2600 and hosts. The connection speed or throughput may be low if any one of the four connections is slow, since the one slow connection will slow down the other 3 connections.

#### ATTENTION

The Destination IP address parameter can be the IP address, domain name, or the name defined in the host table. For some applications, the user may need to send the data actively to the remote destination domain name.

**Designated local port 1** through **4** (default=5010 through 5013): Use these fields to specify the designated local ports.

**Connection control** (default=Startup/None): This setting determines the parameters under which a TCP connection is established or disconnected. The different options are given in the following table. In general, both the Connect condition and Disconnect conditions are given.

| Option  | Description   |
|---|---|
| Startun (None (default)   | A TCP connection will be established on startup, and will remain active           |
| Startup/None (default)  | indefinitely.   |
|   | A TCP connection will be established when any character is received from the      |
| Any Character/None  | serial interface, and will remain active indefinitely.                            |

| DCD On/None   | A TCP connection will be established when a DCD "On" signal is received, and will |
|   | remain active indefinitely.   |

**Packet length** (default=0): This field refers to the maximum amount of data that is allowed to accumulate in the serial port buffer before sending. At the default of 0 for packet length, no maximum amount is specified and data in the buffer will be sent as specified by the delimiter settings or when the buffer is full. When a packet length between 1 and 1024 bytes is specified, data in the buffer will be sent as soon it reaches the specified length.

**Delimiter 1 and Delimiter 2** (default=None): When Delimiter 1 is enabled, the serial port will clear the buffer and send the data to the Ethernet port when a specific character, entered in hex format, is received. A second delimiter character may be enabled and specified in the Delimiter 2 field, so that both characters act as the delimiter to indicate when data should be sent.

#### ATTENTION

In order to enable a delimiter, packet length must be set to 0. Delimiter 2 should only be enabled in conjunction with Delimiter 1 and never on its own; otherwise there may be data errors. Even when a delimiter is enabled, the CN2600 will still pack and send the data when the amount of data exceeds 1 KB.

**Delimiter process** (default=Do Nothing): The Delimiter process field determines how the data is handled when a delimiter is received. Delimiter 1 must be enabled for this field to have effect. If Delimiters 1 and 2 are both enabled, both characters must be received for the delimiter process to take place.

- Do Nothing: Data in the buffer will be transmitted when the delimiter is received.
- Delimiter + 1: Data in the buffer will be transmitted after 1 additional byte is received following the delimiter.
- Delimiter + 2: Data in the buffer will be transmitted after 2 additional bytes are received following the delimiter.
- Strip Delimiter: Data in the buffer is first stripped of the delimiter before being transmitted.

**Force transmit** (default=0 ms): This parameter defines how large a gap in serial communication the CN2600 will allow before packing the serial data in its internal buffer for network transmission.

As data is received through the serial port, it is stored by the CN2600 in the internal buffer. The CN2600 transmits data stored in the buffer via TCP/IP, but only when the internal buffer is full or as specified by the force transmit time. When set to 0, the force transmit time is disabled, and transmission is determined solely by the data in the internal buffer. At 1 to 65535, the TCP/IP protocol software will pack the serial data received after there is a gap in serial communication that exceeds the specified force transmit time.

The optimal force transmit time depends on your application, but it must be at least larger than one character interval within the specified baudrate. For example, assume that the serial port is set to 1200 bps, 8 data bits, 1 stop bit, and no parity. In this case, the total number of bits needed to send a character is 10 bits, and the time required to transfer one character is

(10 (bits) / 1200 (bits/s)) ( 1000 (ms/s) = 8.3 ms.

Therefore, you should set the force transmit time to be larger than 8.3 ms, so in this case, it must be greater than or equal to 10 ms.

If it is necessary to send a series of characters in the same packet, the serial device will need to send that series of characters within the specified force transmit time, and the total length of data must be less than or equal to the CN2600's internal buffer size (1 KB per port).

### **UDP Mode**

**Destination address 1** through **4** (default=None): In UDP mode, you may specify up to 4 ranges of IP addresses for the serial port to connect to. At least one destination range must be provided.

#### ATTENTION

The maximum selectable IP address range is 64 addresses. However, when using multi-unicast, you may enter IP addresses of the form xxx.xxx.255 in the Begin field. For example, enter 192.127.168.255 to allow the CN2600 to broadcast UDP packets to all hosts with IP addresses between 192.127.168.1 and 192.127.168.254.

**Local listen port** (default=4001): This is the UDP port that the CN2600 listens to and that other devices must use to contact the CN2600. To avoid conflicts with well known UDP ports, the default is set to 4001.

**Packet length** (default=0): The Packet length setting refers to the maximum amount of data that is allowed to accumulate in the serial port buffer before sending. At the default of 0 for packet length, no maximum amount is specified and data in the buffer will be sent as specified by the delimiter settings or when the buffer is full. When a packet length between 1 and 1024 bytes is specified, data in the buffer will be sent as soon it reaches the specified length.

**Delimiter 1 and Delimiter 2** (default=None): When Delimiter 1 is enabled, the serial port will clear the buffer and send the data to the Ethernet port when a specific character, entered in hex format, is received. A second delimiter character may be enabled and specified in the Delimiter 2 field, so that both characters act as the delimiter to indicate when data should be sent.

#### ATTENTION

In order to enable a delimiter, packet length must be set to 0. Delimiter 2 should only be enabled in conjunction with Delimiter 1 and never on its own; otherwise there may be data errors. Even when a delimiter is enabled, the CN2600 will still pack and send the data when the amount of data exceeds 1 KB.

**Delimiter process** (default=Do Nothing): The Delimiter process field determines how the data is handled when a delimiter is received. Delimiter 1 must be enabled for this field to have effect. If Delimiters 1 and 2 are both enabled, both characters must be received for the delimiter process to take place.

- Do Nothing: Data in the buffer will be transmitted when the delimiter is received.
- Delimiter + 1: Data in the buffer will be transmitted after 1 additional byte is received following the delimiter.
- Delimiter + 2: Data in the buffer will be transmitted after 2 additional bytes are received following the delimiter.
- Strip Delimiter: Data in the buffer is first stripped of the delimiter before being transmitted.

**Force transmit** (default=0 ms): This parameter defines how large a gap in serial communication the CN2600 will allow before packing the serial data in its internal buffer for network transmission.

As data is received through the serial port, it is stored by the CN2600 in the internal buffer. The CN2600 transmits data stored in the buffer via TCP/IP, but only when the internal buffer is full or as specified by the force transmit time. When set to 0, the force transmit time is disabled, and transmission is determined solely by the data in the internal buffer. At 1 to 65535, the TCP/IP protocol software will pack the serial data received after there is a gap in serial communication that exceeds the specified force transmit time.

The optimal force transmit time depends on your application, but it must be at least larger than one character interval within the specified baudrate. For example, assume that the serial port is set to 1200 bps, 8 data bits, 1 stop bit, and no parity. In this case, the total number of bits needed to send a character is 10 bits, and the time required to transfer one character is

(10 (bits) / 1200 (bits/s)) ( 1000 (ms/s) = 8.3 ms.

Therefore, you should set the force transmit time to be larger than 8.3 ms, so in this case, it must be greater than or equal to 10 ms.

If it is necessary to send a series of characters in the same packet, the serial device will need to send that series of characters within the specified force transmit time, and the total length of data must be less than or equal to the CN2600's internal buffer size (1 KB per port).

## **Redundant COM**

**Max connection** (default=1): This field is used if you need to receive data from different hosts simultaneously. When set to 1, only one specific host can access this port of the CN2600, and the Redundant COM driver on that host will have full control over the port. When set to 2 or greater, up to the specified number of hosts' Redundant COM drivers may open this port at the same time. When multiple hosts' Redundant COM drivers open the port at the same time, the COM driver only provides a pure data tunnel—no control ability. The serial port parameters will use firmware settings instead of depending on your application program (AP).

Application software that is based on the COM driver will receive a driver response of "success" when the software uses any of the Win32 API functions. The firmware will only send data back to the driver on the host.

Data will be sent first-in-first-out when data comes into the CN2600 from the Ethernet interface.

#### ATTENTION

When Max connection is greater than 1, the CN2600 will use a multi connection application (i.e., 2 to 4 hosts are allowed access to the port at the same time). When using a multi connection application, the CN2600 will use the serial communication parameters as defined here in the web console, and all hosts connected to the port must use identical serial settings. If one of the hosts opens the COM port with different serial settings, data will not be transmitted properly.

**Ignore jammed IP** (default=No): This option determines how the port will proceed if multiple hosts are connected and one or more of the hosts stops responding as the port is transmitting data. If you select **No**, the port will wait until the data has been transmitted successfully to all hosts before transmitting the next group of data. If you select **Yes**, the port will ignore the host that stopped responding and continue data transmission to the other hosts.

**Allow driver control** (default=No): This option determines how the port will proceed if driver control commands are received from multiple hosts that are connected to the port. If **No** is selected, driver control commands will be ignored. If **Yes** is selected, control commands will be accepted, with the most recent command received taking precedence.

**Connection goes down** (default=always high): You can configure what happens to the RTS and DTR signals when the Ethernet connection goes down. For some applications, serial devices need to know the Ethernet link status through RTS or DTR signals sent through the serial port. Use **goes low** if you want the RTS and DTR signal to change their state to low when the Ethernet connection goes down. Use **always** high if you do not want the Ethernet connection status to affect the RTS or DTR signals.

**Packet length** (default=0): The Packet length setting refers to the maximum amount of data that is allowed to accumulate in the serial port buffer before sending. At the default of 0 for packet length, no maximum amount is specified and data in the buffer will be sent as specified by the delimiter settings or when the buffer is full. When a packet length between 1 and 1024 bytes is specified, data in the buffer will be sent as soon it reaches the specified length.

**Delimiter 1 and Delimiter 2** (default=None): When Delimiter 1 is enabled, the serial port will clear the buffer and send the data to the Ethernet port when a specific character, entered in hex format, is received. A second delimiter character may be enabled and specified in the Delimiter 2 field, so that both characters act as the delimiter to control when data should be sent.

### ATTENTION

In order to enable a delimiter, packet length must be set to 0. Delimiter 2 should only be enabled in conjunction with Delimiter 1 and never on its own; otherwise there may be data errors. Even when a delimiter is enabled, the CN2600 will still pack and send the data when the amount of data exceeds 1 KB.

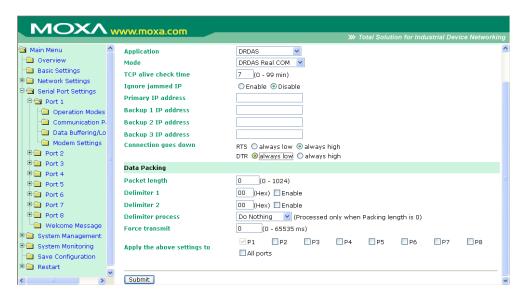

**Delimiter process** (default=Do Nothing): The Delimiter process field determines how the data is handled when a delimiter is received. Delimiter 1 must be enabled for this field to have effect. If Delimiters 1 and 2 are both enabled, both characters must be received for the delimiter process to take place.

- Do Nothing: Data in the buffer will be transmitted when the delimiter is received.
- Delimiter + 1: Data in the buffer will be transmitted after 1 additional byte is received following the delimiter.
- Delimiter + 2: Data in the buffer will be transmitted after 2 additional bytes are received following the delimiter.
- Strip Delimiter: Data in the buffer is first stripped of the delimiter before being transmitted.

**Force transmit** (default=0 ms): This parameter defines how large a gap in serial communication the CN2600 will allow before packing the serial data in its internal buffer for network transmission.

## DRDAS

## DRDAS Real COM

**TCP alive check time** (default=7 min): This field specifies how long the CN2600 will wait for a response to "keep alive" packets before closing the TCP connection. The CN2600 checks connection status by sending periodic "keep alive" packets. If the remote host does not respond to the packet within the time specified in this field, the CN2600 will force the existing TCP connection to close. For socket and device control modes, the CN2600 will listen for another TCP connection from another host after closing the connection. If **TCP alive check time** is set to **0**, the TCP connection will remain open and will not send any "keep alive" packets.

**Ignore jammed IP** (default=No): This option determines how the port will proceed if multiple hosts are connected and one or more of the hosts stops responding as the port is transmitting data. If you select **No**, the port will wait until the data has been transmitted successfully to all hosts before transmitting the next group of data. If you select **Yes**, the port will ignore the host that stopped responding and continue data transmission to the other hosts.

Primary IP address The primary host's IP address.

If left blank, then every host on the network cannot access the serial port.

Backup 1 IP address Backup host's IP address

Backup 2 IP address Backup host's IP address

Backup 3 IP address Backup host's IP address

**Connection goes down** (default=always high): You can configure what happens to the RTS and DTR signals when the Ethernet connection goes down. For some applications, serial devices need to know the Ethernet link status through RTS or DTR signals sent through the serial port. Use **goes low** if you want the RTS and DTR signal to change their state to low when the Ethernet connection goes down. Use **always** high if you do not want the Ethernet connection status to affect the RTS or DTR signals.

**Packet length** (default=0): The Packet length setting refers to the maximum amount of data that is allowed to accumulate in the serial port buffer before sending. At the default of 0 for packet length, no maximum amount is specified and data in the buffer will be sent as specified by the delimiter settings or when the buffer is full. When a packet length between 1 and 1024 bytes is specified, data in the buffer will be sent as soon it reaches the specified length.

**Delimiter 1 and Delimiter 2** (default=None): When Delimiter 1 is enabled, the serial port will clear the buffer and send the data to the Ethernet port when a specific character, entered in hex format, is received. A second delimiter character may be enabled and specified in the Delimiter 2 field, so that both characters act as the delimiter to control when data should be sent.

#### ATTENTION

In order to enable a delimiter, packet length must be set to 0. Delimiter 2 should only be enabled in conjunction with Delimiter 1 and never on its own; otherwise there may be data errors. Even when a delimiter is enabled, the CN2600 will still pack and send the data when the amount of data exceeds 1 KB.

**Delimiter process** (default=Do Nothing): The Delimiter process field determines how the data is handled when a delimiter is received. Delimiter 1 must be enabled for this field to have effect. If Delimiters 1 and 2 are both enabled, both characters must be received for the delimiter process to take place.

- Do Nothing: Data in the buffer will be transmitted when the delimiter is received.
- Delimiter + 1: Data in the buffer will be transmitted after 1 additional byte is received following the delimiter.
- Delimiter + 2: Data in the buffer will be transmitted after 2 additional bytes are received following the delimiter.
- Strip Delimiter: Data in the buffer is first stripped of the delimiter before being transmitted.

**Force transmit** (default=0 ms): This parameter defines how large a gap in serial communication the CN2600 will allow before packing the serial data in its internal buffer for network transmission..

As data is received through the serial port, it is stored by the CN2600 in the internal buffer. The CN2600 transmits data stored in the buffer via TCP/IP, but only when the internal buffer is full or as specified by the force transmit time. When set to 0, the force transmit time is disabled, and transmission is determined solely by the data in the internal buffer. At 1 to 65535, the TCP/IP protocol software will pack the serial data received after there is a gap in serial communication that exceeds the specified force transmit time.

The optimal force transmit time depends on your application, but it must be at least larger than one character interval within the specified baudrate. For example, assume that the serial port is set to 1200 bps, 8 data bits, 1 stop bit, and no parity. In this case, the total number of bits needed to send a character is 10 bits, and the time required to transfer one character is

 $(10 \text{ (bits)} / 1200 \text{ (bits/s)}) \times 1000 \text{ (ms/s)} = 8.3 \text{ ms.}$ 

Therefore, you should set the force transmit time to be larger than 8.3 ms, so in this case, it must be greater than or equal to 10 ms.

If it is necessary to send a series of characters in the same packet, the serial device will need to send that series of characters within the specified force transmit time, and the total length of data must be less than or equal to the CN2600's internal buffer size (1 KB per port).

**TCP alive check time** (default=7 min): This field specifies how long the CN2600 will wait for a response to "keep alive" packets before closing the TCP connection. The CN2600 checks connection status by sending periodic "keep alive" packets. If the remote host does not respond to the packet within the time specified in this field, the CN2600 will force the existing TCP connection to close. For socket and device control modes, the CN2600 will listen for another TCP connection from another host after closing the connection. If **TCP alive check time** is set to **0**, the TCP connection will remain open even if there is no response to the "keep alive" packets.

**Inactivity time** (default=0 ms): This field specifies how long the CN2600 will wait for incoming and outgoing data through the serial port before closing the TCP connection. The TCP connection is closed if there is no incoming or outgoing data through the serial port for the specified **Inactivity time**. If this field is set to **0**, the TCP connection is kept active until a connection close request is received.

**Ignore jammed IP** (default=No): This option determines how the port will proceed if multiple hosts are connected and one or more of the hosts stops responding as the port is transmitting data. If you select **No**, the port will wait until the data has been transmitted successfully to all hosts before transmitting the next group of data. If you select **Yes**, the port will ignore the host that stopped responding and continue data transmission to the other hosts.

**Primary** IP address The primary host's IP address.If left blank, then every host on the network cannot access the serial port.

Backup 1 IP address Backup host's IP address

Backup 2 IP address Backup host's IP address

Backup 3 IP address Backup host's IP address

**TCP Port** TCP data port number Via the data port, users can retrieve data through the async line. TCP port command port number Via the command port, users can issue commands across the network to set the line's configuration parameters, such as baudrate, data bits, flow control condition, etc.

**Connection goes down** (default=always high): You can configure what happens to the RTS and DTR signals when the Ethernet connection goes down. For some applications, serial devices need to know the Ethernet link status through RTS or DTR signals sent through the serial port. Use **goes low** if you want the RTS and DTR signal to change their state to low when the Ethernet connection goes down. Use **always** high if you do not want the Ethernet connection status to affect the RTS or DTR signals.

**Packet length** (default=0): The Packet length setting refers to the maximum amount of data that is allowed to accumulate in the serial port buffer before sending. At the default of 0 for packet length, no maximum amount is specified and data in the buffer will be sent as specified by the delimiter settings or when the buffer is full. When a packet length between 1 and 1024 bytes is specified, data in the buffer will be sent as soon it reaches the specified length.

**Delimiter 1 and Delimiter 2** (default=None): When Delimiter 1 is enabled, the serial port will clear the buffer and send the data to the Ethernet port when a specific character, entered in hex format, is received. A second delimiter character may be enabled and specified in the Delimiter 2 field, so that both characters act as the delimiter to control when data should be sent.

#### ATTENTION

In order to enable a delimiter, packet length must be set to 0. Delimiter 2 should only be enabled in conjunction with Delimiter 1 and never on its own; otherwise there may be data errors. Even when a delimiter is enabled, the CN2600 will still pack and send the data when the amount of data exceeds 1 KB.

**Delimiter process** (default=Do Nothing): The Delimiter process field determines how the data is handled when a delimiter is received. Delimiter 1 must be enabled for this field to have effect. If Delimiters 1 and 2 are both enabled, both characters must be received for the delimiter process to take place.

- Do Nothing: Data in the buffer will be transmitted when the delimiter is received.
- Delimiter + 1: Data in the buffer will be transmitted after 1 additional byte is received following the delimiter.
- Delimiter + 2: Data in the buffer will be transmitted after 2 additional bytes are received following the delimiter.
- Strip Delimiter: Data in the buffer is first stripped of the delimiter before being transmitted.

**Force transmit** (default=0 ms): This parameter defines how large a gap in serial communication the CN2600 will allow before packing the serial data in its internal buffer for network transmission.

As data is received through the serial port, it is stored by the CN2600 in the internal buffer. The CN2600 transmits data stored in the buffer via TCP/IP, but only when the internal buffer is full or as specified by the force transmit time. When set to 0, the force transmit time is disabled, and transmission is determined solely by the data in the internal buffer. At 1 to 65535, the TCP/IP protocol software will pack the serial data received after there is a gap in serial communication that exceeds the specified force transmit time.

The optimal force transmit time depends on your application, but it must be at least larger than one character interval within the specified baudrate. For example, assume that the serial port is set to 1200 bps, 8 data bits, 1 stop bit, and no parity. In this case, the total number of bits needed to send a character is 10 bits, and the time required to transfer one character is

 $(10 \text{ (bits)} / 1200 \text{ (bits/s)}) \times 1000 \text{ (ms/s)} = 8.3 \text{ ms.}$ 

Therefore, you should set the force transmit time to be larger than 8.3 ms, so in this case, it must be greater than or equal to 10 ms.

If it is necessary to send a series of characters in the same packet, the serial device will need to send that series of characters within the specified force transmit time, and the total length of data must be less than or equal to the CN2600's internal buffer size (1 KB per port).

**TCP alive check time** (default=7 min): This field specifies how long the CN2600 will wait for a response to "keep alive" packets before closing the TCP connection. The CN2600 checks connection status by sending periodic "keep alive" packets. If the remote host does not respond to the packet within the time specified in this field, the CN2600 will force the existing TCP connection to close. For socket and device control modes, the CN2600 will listen for another TCP connection from another host after closing the connection. If **TCP alive check time** is set to **0**, the TCP connection will remain open even if there is no response to the "keep alive" packets.

**Inactivity time** (default=0 min): This field specifies how long the CN2600 will wait for incoming and outgoing data through the serial port before closing the TCP connection. The TCP connection is closed if there is no incoming or outgoing data through the serial port for the specified **Inactivity time**. If this field is set to **0**, the TCP connection is kept active until a connection close request is received.

### ATTENTION

Inactivity time should at least be set larger than that of Force transmit time. To prevent the unintended loss of data due to the session being disconnected, it is highly recommended that this value is set large enough such that the intended data transfer is completed.

**Auto-Link Protocol**: If this field is set to **None**, the CN2600 will not connect to the host automatically. If Auto-Link Protocol is set to **Telnet** or **Rlogin**, the CN2600 will connect to the host automatically using the specified protocol.

**Primary** and **Secondary host address**: If specified, the fields designate permanent hosts to which the terminal will always be connected.

**Telnet TCP port** (default=23): By default, the Telnet TCP port number is set to 23, which is the default TCP port number for Telnet.

**Terminal type** (default=ansi): Some older terminal applications may require that the terminal type be transmitted before the connection can be established. You may need to refer to the server's documentation

to determine the appropriate terminal type. For most applications, this setting will be unnecessary and will have no effect

**Max. Sessions** (default=4): This setting allows you to configure the maximum. number of sessions allowed for the serial port.

**Change Session** (default=(^T)0x14): This field defines the quick key to change a session.

**Quit** (default=( $^E$ )0x05): This field defines the quick key to quit a session.

Break: This field defines the quick key to send a break signal.

**Interrupt**: This field defines the quick key for program termination.

Authentication type (default=None): This field allows you to configure the method used, if any, to verify a user's ID and authorization.

| Option | Description                                       |  |
|--------|---|--|
| Local  | Verify the ID against the CN2600 User Table.      |  |
| RADIUS | Verify the ID against the external RADIUS server. |  |
| None   | Authentication is not required.                   |  |

Auto-login prompt (default=ogin:)

Password prompt (default=assword:)

Login user name: Enter the terminal login ID here.

**Login password**: Enter the password for the terminal login here.

## Terminal BIN (TERM\_BIN)

Terminal Binary mode can be used to transfer files with XMODEM or ZMODEM. You are only allowed to open one terminal session at a time when in Terminal Binary mode.

**TCP alive check time** (default=7 min): This field specifies how long the CN2600 will wait for a response to "keep alive" packets before closing the TCP connection. The CN2600 checks connection status by sending periodic "keep alive" packets. If the remote host does not respond to the packet within the time specified in this field, the CN2600 will force the existing TCP connection to close. For socket and device control modes, the CN2600 will listen for another TCP connection from another host after closing the connection. If **TCP alive check time** is set to **0**, the TCP connection will remain open even if there is no response to the "keep alive" packets.

**Inactivity time** (default=0 min): This field specifies how long the CN2600 will wait for incoming and outgoing data through the serial port before closing the TCP connection. The TCP connection is closed if there is no incoming or outgoing data through the serial port for the specified **Inactivity time**. If this field is set to **0**, the TCP connection is kept active until a connection close request is received.

#### ATTENTION

Inactivity time should at least be set larger than that of Force transmit time. To prevent the unintended loss of data due to the session being disconnected, it is highly recommended that this value is set large enough so that the intended data transfer is completed.

**Auto-Link Protocol**: If this field is set to **None**, the CN2600 will not connect to the host automatically. If Auto-Link Protocol is set to **Telnet** or **Rlogin**, the CN2600 will connect to the host automatically using the specified protocol.

**Primary** and **Secondary host address**: If specified, the fields designate permanent hosts to which the terminal will always be connected.

**Telnet TCP port** (default=23): By default, the Telnet TCP port number is set to 23, which is the default TCP port number for Telnet.

**Terminal type** (default=ansi): Some older terminal applications may require that the terminal type be transmitted before the connection can be established. You may need to refer to the server's documentation to determine the appropriate terminal type. For most applications, this setting will be unnecessary and will have no effect

**Quit** (default=( $^E$ ) 0x05): This field configures the quick key used to disconnect the link between the current terminal session and the remote host. It is not necessary for binary communication.

Authentication type (default=None): This field allows you to configure the method used, if any, to verify a user's ID and authorization.

| Option | Description                                       |  |

**TCP alive check time** (default=7 min): This field specifies how long the CN2600 will wait for a response to "keep alive" packets before closing the TCP connection. The CN2600 checks connection status by sending periodic "keep alive" packets. If the remote host does not respond to the packet within the time specified in this field, the CN2600 will force the existing TCP connection to close. For socket and device control modes, the CN2600 will listen for another TCP connection from another host after closing the connection. If **TCP alive check time** is set to **0**, the TCP connection will remain open even if there is no response to the "keep alive" packets.

**Inactivity time** (default=0 min): This field specifies the idle time setting for auto-disconnection. A setting of 0 min. will cause the port to remain connected even if idle.

**TCP port** (default=4001): This is the TCP port number assignment for the serial port on the CN2600. It is the port number that the serial port uses to listen to connections, and that other devices must use to contact the serial port. To avoid conflicts with well known TCP ports, the default is set to 4001.

**Authentication type** (default=None): This field allows you to configure the method used, if any, to verify a user's ID and authorization.

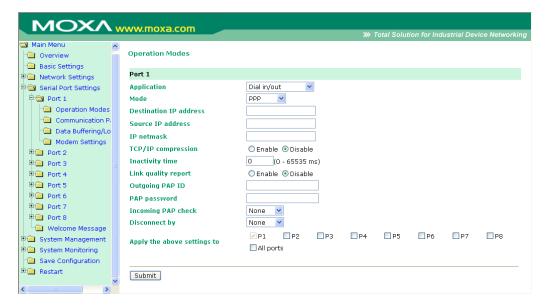

| Option | Description                                       |  |

# **Dial In/Out Applications**

## **PPP Mode**

PPP provides standard PPP service for both dial-in and dial-out.

Destination IP address: This is the IP address of the remote dial-in/ dial-out server.

Source IP address: The Source IP address is IP address assigned to this serial port.

IP netmask: The IP netmask defines the netmask, also known as the subnet mask, for the PPP connection

**TCP/IP compression** (default=No): The setting of this field depends on whether the remote user's application requests compression.

**Inactivity time** (default=0 ms): This field specifies the idle time setting for auto-disconnection. A setting of 0 ms will cause the port to remain connected even if idle.

**Link quality report** (default=No): Setting this field to **Yes** allows the CN2600 to disconnect a connection if the link noise exceeds a certain threshold.

Outgoing PAP ID: This is the dial-out user ID account.

PAP password: This is the dial-out user password.

**Incoming PAP check** (default=None): This field allows you to configure the method used, if any, to verify a user's ID and authorization.

| Option | Description                                       |  |
|--------|---|--|
| Local  | Verify the ID against the CN2600 User Table.      |  |
| RADIUS | Verify the ID against the external RADIUS server. |  |
| None   | Authentication is not required.                   |  |

PPPD (PPP on demand) is used for dial-in services, since it provides PPP services only when receiving a request from a remote PC.

Destination IP address: This is the IP address of the remote dial-in/ dial-out server.

Source IP address: The Source IP address is IP address assigned to this serial port.

IP netmask: The IP netmask defines the netmask, also known as the subnet mask, for the PPP connection

**TCP/IP compression** (default=No): The setting of this field depends on whether the remote user's application requests compression.

**Inactivity time** (default=0 ms): This field specifies the idle time setting for auto-disconnection. A setting of 0 ms will cause the port to remain connected even if idle.

**Link quality report** (default=No): Setting this field to **Yes** allows the CN2600 to disconnect a connection if the link noise exceeds a certain threshold.

**Outgoing PAP ID**: This is the dial-out user ID account.

**PAP password**: This is the dial-out user password.

**Incoming PAP check** (default=None): This field allows you to configure the method used, if any, to verify a user's ID and authorization.

| Option | Description                                       |  |
|--------|---|--|
| Local  | Verify the ID against the CN2600 User Table.      |  |
| RADIUS | Verify the ID against the external RADIUS server. |  |
| None   | Authentication is not required.                   |  |

#### **SLIP Mode**

SLIP provides standard SLIP service for both dial-in and dial-out.

Destination IP address: This is the IP address of the remote dial-in/ dial-out server.

Source IP address: The Source IP address is IP address assigned to this serial port.

IP netmask: The IP netmask defines the netmask, also known as the subnet mask, for the SLIP connection

**TCP/IP compression** (default=No): The setting of this field depends on whether the remote user's application requests compression.

**Inactivity time** (default=0 ms): This field specifies the idle time setting for auto-disconnection. A setting of 0 ms will cause the port to remain connected even if idle.

Dynamic mode integrates PPPD, SLIPD, and Terminal dial-in services. Dynamic mode automatically detects which remote connection mode is being used, and provides corresponding services. You can individually enable/disable PPP/SLIP/Terminal services by selecting Yes or No next to the corresponding option. Yes will enable that type of service; No will disable it.

**Authentication type** (default=None): This field allows you to configure the method used, if any, to verify a user's ID and authorization.

| Option | Description                                       |
|--------|---|
| Local  | Verify the ID against the CN2600 User Table.      |
| RADIUS | Verify the ID against the external RADIUS server. |
| None   | Authentication is not required.                   |

When the **Application** is set to **Disable**, the relevant port will be disabled.

In this chapter, we describe additional serial port settings on the CN2600. The same configuration options are also available through the telnet and serial console.

## **Port Communication Parameters**

Port alias: This optional field allows you to assign an alias to a port for easier identification.

## **Serial Parameters**

#### ATTENTION

The serial parameters for the each serial port on the CN2600 should match the parameters used by the connected serial device. You may need to refer to your serial device's user's manual to determine the appropriate serial communication parameters.

**Baud rate** (default=115200 bps): This field configures the port's baudrate. Select one of the standard baudrates from the dropdown box, or select **Other** and then type the desired baudrate in the input box.

#### ATTENTION

If the port requires a special baudrate that is not listed, such as 500000 bps, you may can select the Other option and enter the desired baudrate into the text box. The CN2600 will automatically calculate the closest supported baudrate. The margin for error will be less than 1.7% for all baudrates under 921600 bps.

**Data bits** (default=8): This field configures the data bits parameter. Note: If data bits is set to 5 bits, stop bits will automatically be set to 2 bits.

**Stop bits** (default=1): This field configures the stop bits parameter. Note: If data bits is set to 5 bits, stop bits will automatically be set to 1.5 bits.

Parity (default=None): This field configures the parity parameter.

Flow control (default=RTS/CTS): This field configures the flow control type.

**FIFO** (default=Enable): This field enables or disables the 128-byte FIFO buffer. The CN2600 provides FIFO buffers for each serial port, for both the Tx and Rx signals. Note, however, that you should disable the port's FIFO setting if the attached serial device does not have a FIFO buffer of its own. This is because a serial device that does not have its own buffer may not be able to keep up with data sent from the CN2600's FIFO buffer.

**Interface** (default=RS-232): You may configure the serial interface to RS-232, RS-422, RS-485 2-wire, or RS-485 4-wire.

| ~  |   |                                      |         |             |              |              |                |
|  |   |                                      |         |             |              |              |                |

The CN2600 supports port buffering to prevent the loss of serial data when the Ethernet connection is down. Port buffering can be used in TCP Server and TCP Client modes. For other modes, the port buffering settings will have no effect.

**Port buffering enable** (default=No): You may enable port buffering by setting this field to **Yes**.

**Serial data logging enable** (default=No): If this field is set to Yes, the CN2600 will store data logs on the system RAM for all serial ports. Note that this data is not saved when the CN2600 is powered off. Each serial port is allotted 128 KB to store that port's log file.

The CN2600 uses an IP address-based filtering method to control access to its serial ports.

The Accessible IP list allows you restrict network access to the CN2600. Access is controlled by IP address. When the accessible IP list is enabled, a host's IP address must be listed in order to have access to the CN2600. You may add a specific address or range of addresses by using a combination of IP address and netmask, as follows:

#### To allow access to a specific IP address

Enter the IP address in the corresponding field; enter 255.255.255.255 for the netmask.

#### To allow access to hosts on a specific subnet

For both the IP address and netmask, use **0** for the last digit (e.g., **192.168.1.0** and **255.255.255.0**).

#### To allow unrestricted access

Deselect the Enable the accessible IP list option.

Refer to the following table for more configuration examples.

| Allowed hosts                  | Entered IP address/Netmask      |
|--------------------------------|---------------------------------|
| Any host                       | Disable                         |
| 192.168.1.120                  | 192.168.1.120 / 255.255.255.255 |
| 192.168.1.1 to 192.168.1.254   | 192.168.1.0 / 255.255.255.0     |
| 192.168.0.1 to 192.168.255.254 | 192.168.0.0 / 255.255.0.0       |
| 192.168.1.1 to 192.168.1.126   | 192.168.1.0 / 255.255.255.128   |
| 192.168.1.129 to 192.168.1.254 | 192.168.1.128 / 255.255.255.128 |

#### ATTENTION

The Accessible IP List will not be used if you configure the serial port for DRDAS Real COM mode or DRDAS TCP Server mode. In this case, the Primary IP address, three Backup IP addresses, and filtering method from the DRDAS configuration will be used.

**SNMP**: To enable the SNMP Agent function, select the **Enable** option, and enter a community name (e.g., **public**).

**Read community string** (default=public): This is a text password mechanism that is used to weakly authenticate queries to agents of managed network devices.

**Write community string** (default=private): This is a text password mechanism that is used to weakly authenticate changes to agents of managed network devices.

**Contact name**: The optional SNMP contact information usually includes an emergency contact name and telephone or pager number.

**Location**: Use this optional field to specify the location string for SNMP agents such as the CN2600. This string is usually set to the street address where the CN2600 is physically located.

SNMP agent version: The CN2600 supports SNMP V1, V2, and V3.

#### Read-only and Read/write access control

The following fields allow you to define user names, passwords, and authentication parameters for two levels of access: read-only and read/write. The name of the field will indicate which level of access it refers to. For example, **Read only** authentication mode allows you to configure the authentication mode for read-only access, whereas **Read/write** authentication mode allows you to configure the authentication mode for read/write access. For each level of access, you may configure the following:

User name: Use this optional field to identify the user name for the specified level of access.

**Authentication mode** (default=Disable): Use this field to select MD5 or SHA as the method of password encryption for the specified level of access, or to disable authentication

**Privacy mode** (default=Disable): Use this field to enable to disable DES\_CBC data encryption for the specified level of access.

Password: Use this field to set the password for the specified level of access.

Privacy: Use this field to define the encryption key for the specified level of access

#### DDNS

Please refer t to Appendix C, Dynamic Domain Name Server, for information on setting up DDNS on your CN2600.

#### **Host Table**

| MOXA www.moxa.com     W Total Solution for Industrial Device Networking  |
|--|
| Port 9   Port 10   Port 11   Port 12   Port 13   Port 14   Port 15   Port 16   Welcome Message   System Management   Misc. Network Settings   System Log Settings   Misc. Network Settings   Misc. Network Settings   Misc. Network Settings   Misc. Network Settings   System Log Settings   Misc. Network Settings   System Monitoring   Save Configuration   State Setter |

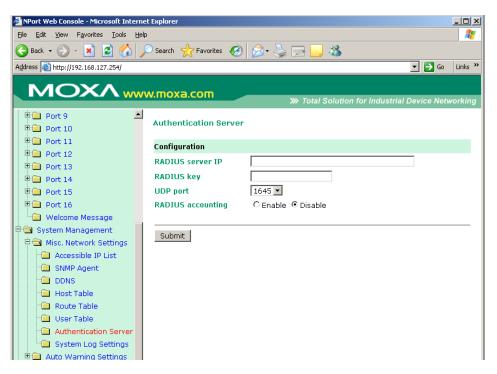

The Host Table may be used to simplify IP address entry on the CN2600 console by assigning a Host Name to a Host IP Address. When you assign a Host Name to a Host IP Address, you may then use the Host Name for some fields on the console rather than entering the IP address. Up to 16 entries can be stored on the Host Table.

The CN2600 User Table may be used for to authenticate users for terminal or reverse terminal access and is useful if you do not have an external RADIUS server for authentication. The CN2600 User Table stores up to 64 entries, with fields for User Name, Password, and Phone Number.

### **Authentication Server**

RADIUS server IP: If you are using a RADIUS server for user authentication, enter its IP address here.
RADIUS key: If you are using a RADIUS server for user authentication, enter its password here.
UDP port (default=1645): If you are using a RADIUS server, enter its UDP port assignment here.
RADIUS accounting: Use this field to enable or disable RADIUS accounting.

System Log Settings allows the administrator to customize which network events are logged by the CN2600. Events are grouped into four categories, known as event groups, and the administrator selects which groups to log under Local Log. The actual system events that would be logged for each system group are listed under summary. For example, if **System** was enabled, then System Cold Start events and Power Down events (for 2AC model) would be logged.

| Group   | Event  |  |  |
|---------|--|--|--|
| System  | System Cold Start, System Warm Start, Power Down   |  |  |
| Network | DHCP/BOOTP/PPPoE Get IP/Renew, NTP, Mail Fail, NTP Connect Fail, DHCP Fail, IP Conflict, |  |  |
| Network | Ethernet Link Down   |  |  |
| Config  | Login Fail, IP Changed, Password Changed, Config Changed, Firmware Upgrade, SSL Key      |  |  |
| Coning  | Import, Config Import, Config Export   |  |  |
| OpMode  | Connect, Disconnect, Authentication Fail, Restart  |  |  |

|   | Submit                            |        |  |

On the Event Settings page, you may configure how administrators are notified of certain system, network, and configuration events. Depending on the event, different options for automatic notification are available, as shown above. **Mail** refers to sending an e-mail to a specified address. **Trap** refers to sending an SNMP Trap.

Cold start: This refers to starting the system from a power off state, or after upgrading your firmware

Warm start: This refers to restarting the CN2600 without turning the power off.

**Power down**: Power1 and Power2 refer to the built-in power jacks. If either power fails, the CN2600 will attempt to send an e-mail warning.

**Network Event: Ethernet1 and Ethernet2** refer to the built-in Ethernet ports. These settings configure the CN2600 to change the status of the relay output and alarm LED if the specified connection goes down.

**Console(web/text) login auth fail**: This field refers to a failed attempt to log in to a password- protected CN2600 console.

**IP changed**: With this option selected, the CN2600 will attempt to send an e-mail warning before it reboots after an IP address change. However, the CN2600 will reboot with the new IP address regardless of whether or not the e-mail transmission is successful.

**Password changed**: With this option selected, the CN2600 will attempt to send an e-mail warning before it reboots with a new console password. If the CN2600 is unable to send an e-mail message to the mail server within 15 seconds, it will still reboot without sending the e-mail.

## **Serial Event Settings**

| Overview   | Port Event Settings |             |        |             |        |

| 🗀 SNMP Trap  | Port 8              | 🔲 Mail      | Trap   | 🔲 Mail      | 🗌 Trap |
| <ul> <li>Maintenance</li> <li>Certificate</li> </ul> | All ports           | 🗖 Mail      | Trap   | 📃 Mail      | 🗌 Trap |

On the **Serial Event Settings** page, you may configure how administrators are notified of each serial port's DCD and DSR changes. Mail refers to sending an e-mail to a specific address. Trap refers to sending an SNMP Trap.

#### **DCD** changed

A change in the DCD (Data Carrier Detect) signal indicates that the modem connection status has changed. For example, if the DCD signal changes to low, it indicates that the connection line is down. When the DCD signal changes to low, the CN2600 will automatically send a warning to the administrator as configured on the Serial Event Settings page.

#### DSR changed

A change in the DSR (Data Set Ready) signal indicates that the data communication equipment is powered off. For example, if the DSR signal changes to low, it indicates that the data communication equipment is powered down. When the DSR signal changes to low, the CN2600 will automatically send a warning to the administrator as configured on the Serial Event Settings page.

#### ATTENTION

SNMP indicates a change in DCD or DSR signals but does not differentiate between the two. A change in either signal from "-" to "+" is indicated by "link up" and a change in either signal from "+" to "-" is indicated by "link down."

The E-mail Alert settings configure how e-mail warnings are sent for system and serial port events. You may configure up to 4 e-mail addresses to receive automatic warnings.

#### ATTENTION

Consult your Network Administrator or ISP for the proper mail server settings. The Auto warning function may not work properly if it is not configured correctly. The CN2600's SMTP AUTH supports LOGIN, PLAIN, and CRAM-MD5 (RFC 2554).

Mail server: This field is for your mail server's domain name or IP address.

**User name**: This field is for your mail server's user name, if required.

**Password**: This field is for your mail server's password, if required.

From e-mail address: This is the e-mail address from which automatic e-mail warnings will be sent.

**To e-mail address 1** to **4**: This is the e-mail address or addresses to which the automatic e-mail warnings will be sent.

On this screen, access to different CN2600 configuration console options (HTTP, HTTPS, Telnet, SSH) can be enabled or disabled. TLS v1.0/v1.1 for HTTPS console can also be enabled or disabled (except for CN2610-8 and CN2610-16). Due to security considerations, the default value is set to "Disable". The CN2600 front panel, known as the LCM (Liquid Crystal Module), may be configured for read-only or writeable access. In other words, you can use the front panel to check console settings only (read only access) or to actually change the settings (writeable access). Note that if the console is password-protected and LCM is configured for writeable access, you will need to enter the password to submit any console setting changes. Please refer to *Change Password* later in this chapter for more information on passwords. Finally, you may also enable or disable the reset button.

| Configuration Import   |  |          |  |  |  |
| Configuration Export   |  |          |  |  |  |

The CN2600's firmware can be upgraded though the web console, serial console, or through NPort Search Utility. If you have made any changes to your configuration, remember to save the configuration first before upgrading the firmware. Please refer to *Save Configuration* later in this chapter for more information. Any unsaved changes will be discarded when the firmware is upgraded. To upgrade the firmware, simply enter the file name and click **Submit**. The latest firmware can be downloaded at <u>www.moxa.com</u>.

## **Configurating Import/Export**

The CN2600 can share or back up its configuration by exporting all settings to a file, which can then be imported into another CN2600.

| Configuration Export   |                           |   |

To import a configuration, go to **System Management ( Maintenance ( Configuration Import**. Enter the configuration file path/name and click **Submit**. The CN2600's configuration settings will be updated according to the configuration file. If you also wish to import the IP configuration (i.e., the CN2600's IP address, netmask, gateway, etc.), make sure that **Import all configurations including IP configurations** is checked off.

To export a configuration, go to **System Management ( Maintenance ( Configuration Export** and click **Download**. A standard download window will appear, and you will be able to download the configuration into a file name and location of your choice.

### Load Factory Defaults

| ΜΟΧΛω  | WW.MOXa.COM   |
|--|---|
| <ul> <li>Main Menu</li> <li>Overview</li> <li>Basic Settings</li> <li>Network Settings</li> <li>Serial Port Settings</li> <li>System Management</li> <li>Misc. Network Settings</li> <li>Auto Warning Settings</li> <li>Maintenance</li> <li>Console Settings</li> </ul> | Total Solution for Industrial Device Networking  Load Factory Default  Click on Submit to reset all settings, including the console password, to the factory default values. To leave the IP address, netmask, gateway and WLAN profile settings unchanged, make sure that Keep IP Settings is enabled.  Reset to Factory Default  Keep IP settings  Submit |
| Ping     Ping     Firmware Upgrade     Configuration Import     Configuration Export     Load Factory Default     Change Password     Certificate  |   |

This function will reset all of CN2600's settings to the factory default values. All previous settings including the console password will be lost. If you wish to keep the CN2600 IP address, netmask, and other IP settings, make sure **Keep IP settings** is checked off before loading the factory defaults.

#### **Change Password**

| 🗄 🦳 System Monitoring                     |                  |  |

For all changes to the CN2600's password protection settings, you will first need to enter the old password. Leave this blank if you are setting up password protection for the first time. To set up a new password or change the existing password, enter your desired password under both **New password** and **Confirm password**. To remove password protection, leave the **New password** and **Confirm password** boxes blank.

#### ATTENTION

If you forget the password, the ONLY way to configure the CN2600 is by using the reset button on the CN2600's casing to load the factory defaults.

Before you set a password for the first time, it is a good idea to export the configuration to a file when you have finished setting up your CN2600. Your configuration can then be easily imported back into the CN2600 if you need to reset the CN2600 due to a forgotten password or for other reasons. Please refer to the section on Configuration Import/Export earlier in this chapter for more details.

## Certificate

## **Ethernet SSL Certificate Import**

## **Certificate/Key Delete**

## **System Monitoring**

## **Serial to Network Connections**

Go to **Serial to Network Connections** under **Serial Status** to view the operation mode and status of each connection, for each serial port. All monitor functions will refresh automatically every 5 seconds.

Go to Routing under System Status to display the routing information.

## **Save Configuration**

Go to **Save Configuration** and then click **Save** to save the your submitted configuration changes to the CN2600's flash memory. The configuration changes will then be effective when the CN2600 is restarted. If you do not save your changes before restarting, they will be discarded.

## Restart

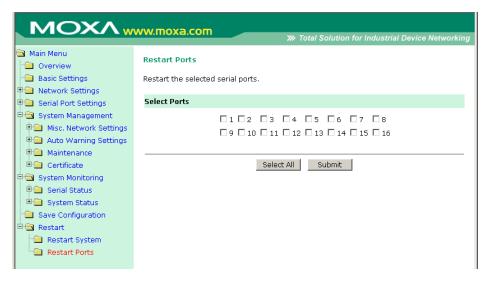

#### **Restart System**

Go to **Restart System** under **Restart** and then click **Restart** to restart the CN2600. Ensure that you save all your configuration changes before you restart the system or else these changes will be lost.

#### **Restart Ports**

Go to **Restart Ports** under **Restart** and then select the ports to be restarted. Click **Select All** to select all the ports. Click **Submit** to restart the selected ports.

# 9. Software Installation/Configuration

## **NPort Search Utility**

### **Installing NPort Search Utility**

- 1. Click the INSTALL UTILITY button in the Installation CD auto-run window to install NPort Search Utility. Once the program starts running, click **Yes** to proceed.
- 2. Click **Next** when the Welcome screen opens, to proceed with the installation.

3. Click **Next** to install program files to the default directory, or click **Browse** to select an alternate location.

| Setup - NPort Search Utility   |                                 |                 |
|--|---------------------------------|-----------------|
| Select Destination Location<br>Where should NPort Search Utility be in | nstalled?                       |                 |

## **Configuring NPort Search Utility**

The **Broadcast Search** function is used to locate all CN2600 servers that are connected to the same LAN as your computer. After locating a CN2600, you will be able to change its IP address.

Since the **Broadcast Search** function searches by MAC address and not IP address, all CN2600 servers connected to the LAN will be located, regardless of whether or not they are part of the same subnet as the host.

## **Windows Driver Manager**

### **Installing NPort Windows Driver Manager**

The NPort Windows Driver Manager can be used with CN2600 serial ports that are set to Real COM mode. The Driver Manager manages the installation of drivers, which allow you to map unused COM ports on your PC to serial ports on the CN2600. These drivers are designed for use with Windows 95/98/ME/NT/2000/XP/2003/Vista. When the drivers are installed and configured, devices that are attached to serial ports on the CN2600 will be treated as if they were attached to your PC's own COM ports.

If you are using the older version named Async Server Windows 2000/XP/2003 driver, please refer to Chapter 9, *Setting up Hosts* for installation information. Note that you may also download the latest Windows Driver Manager from Moxa's website.

- 1. Click the INSTALL COM Driver button in the CN2600 Installation CD auto-run window to install NPort Windows Driver Manager. Once the installation program starts running, click **Yes** to proceed.
- 2. Click Next when the Welcome screen opens to proceed with the installation.

3. Click **Next** to install program files to the default directory, or click **Browse** to select an alternate location.

| 🚰 Setup - NPort Windows Driver Manager   |
|--|
| Select Destination Location<br>Where should NPort Windows Driver Manager be installed? |
| Setup will install NPort Windows Driver Manager into the following folder.             |
| To continue, click Next. If you would like to select a different folder, click Browse. |
| C:\Program Files\NPortDrvManager Browse  |
| At least 1.4 MB of free disk space is required.  |
| < Back Next > Cancel   |

4. Click **Next** to install the program's shortcuts in the appropriate **Start Menu** folder.

| j🕏 Setup - NPort Windows Driver Manager  |   |

7. Click Finish to complete the installation of the CN2600 Windows Driver Manager.

| 🔂 Setup - NPort Windows Dr | ver Manager   |
|----------------------------|---|
| Setup - NPort Windows Dr   | Completing the NPort Windows     Driver Manager Setup Wizard     Setup has finished installing NPort Windows Driver Manager on     your computer. The application may be launched by selecting     the installed icons.     Click Finish to exit Setup.     Launch NPort Windows Driver Manager |
|                            | Finish  |

#### **Using NPort Windows Driver Manager**

After you install the NPort Windows Driver Manager, you can set up the CN2600's serial ports as remote COM ports for your PC host. Be sure the serial port(s) on your CN2600 are set to **Redundant COM** mode when using NPort Windows Driver Manager to map COM ports.

- 1. Go to Start > CN2600 series Windows Driver Manager > CN2600 series Windows Driver Manager to start the COM mapping utility.
- 2. Click the Add icon.

To re-configure the settings for a particular serial port on the CN2600, select the row corresponding to the desired port, and then click the **Settings** icon.

7. On the Basic Settings page, use the COM Number drop-down list to select a COM number to be assigned to the CN2600 serial port that is being configured. Select the Auto Enumerating COM Number for Selected Ports option to assign available COM numbers automatically in sequence to selected serial ports. Note that ports that are "in use" will be labeled accordingly.

 Enable Redundant COM, which enables the 2 LANs automatically, is the default. If Disable Redundant COM is selected, Real COM mode will be used, and either LAN can be selected for mapping the IP address.

#### NOTE

Before configuring the driver for "Redundant COM" mode, you must first configure the corresponding port of the CN2600's firmware for "Redundant COM" mode.

9. Click the Advanced Settings tab to modify Tx Mode, FIFO, and Flash Flush.

| ? <u>H</u> elp   | V OK X Cancel  |

#### > Tx Mode

**Hi-Performance** is the default for Tx mode. After the driver sends data to the CN2600, the driver immediately issues a "Tx Empty" response to the program. Under **Classical mode**, the driver will not send the "Tx Empty" response until after confirmation is received from the CN2600's serial port. This causes lower throughput. Classical mode is recommended if you want to ensure that all data is sent out before further processing.

#### > FIFO

If **FIFO** is **Disabled**, the CN2600 will transmit one byte each time the Tx FIFO becomes empty, and an Rx interrupt will be generated for each incoming byte. This will result in a faster response and lower throughput.

#### > Network Timeout

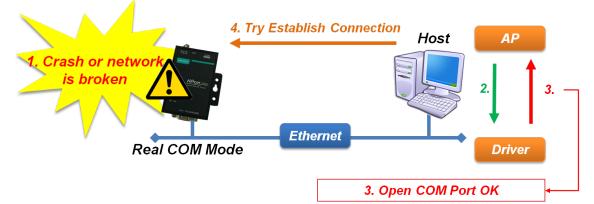

You can use this option to prevent blocking if the target CN2600 is unavailable.

#### > Auto Network Re-Connection

With this option enabled, the driver will repeatedly attempt to re-establish the TCP connection if the CN2600 does not respond to background "check alive" packets.

#### > Always Accept Open Requests

When the driver cannot establish a connection with the NPort, the user's software can still open the mapped COM port, just like an onboard COM port.

#### > Return error if network is unavailable

If this option is disabled, the driver will not return any error even when a connection cannot be established to the CN2600. With this option enabled, calling the Win32 Comm function will result in the error return code "STATUS\_NETWORK\_UNREACHABLE" when a connection cannot be established to the CN2600. This usually means that your host's network connection is down, perhaps due to a cable being disconnected. However, if you can reach other network devices, it may be that the CN2600 is not powered on or is disconnected. Note that **Auto Network Re-Connection** must be enabled in order to use this function.

#### Fast Flush (only flushes the local buffer)

For some applications, the user's program will use the Win32 "PurgeComm()" function before it reads or writes data. After a program uses this PurgeComm() function, the CN2600 driver will continue to query the CN2600 firmware several times to make sure no data is queued in the CN2600 firmware buffer, rather than just flushing the local buffer. This design is used to satisfy some special considerations. However, it may take more time (on the order of several hundred milliseconds) than a native COM1 due to the additional time spent communicating across the Ethernet. This is why PurgeComm() works significantly faster with native COM ports on the PC than with mapped COM ports on the CN2600. In order to accommodate other applications that require a faster response time, the new CN2600 driver implements a new Fast Flush option. By default, this function is enabled.

If you have disabled Fast Flush and find that COM ports mapped to the CN2600 perform markedly slower than when using a native COM port, try to verify if "PurgeComm()" functions are used in your application. If so, try enabling the Fast Flush function and see if there is a significant improvement in performance.

#### > Ignore TX Purge

Applications can use the Win32 API PurgeComm to clear the output buffer. Outstanding overlapping write operations will be terminated. Select the **Ignore TX Purge** checkbox to ignore the effect on output data.

10. The **Serial Parameters** page shown in the following figure shows the default settings when the CN2600 is powered on. However, the program can redefine the serial parameters to different values after the program opens the port via Win 32 API.

| COM Port Setting   |                  |   | >        |

11. Click the Security tab to configure security settings. Select the Enable Data Encryption option to enable data to be encrypted when transmitted over the COM ports. After selecting the encryption option, select the Keep connection option to start encrypting COM port communications immediately without restarting the COM ports. (If your application will open/close a COM port frequently and the CN2600 is only used for one host, you can enable this option to speed up the opening/closing time. However, this will result in your host tying up the COM port so that other hosts cannot use it.) Select the Apply All Selected Ports option to enable the security settings to be applied to all COM ports.

## **Windows Monitor Utility**

### **Installing the NPort Monitor Utility**

The NPort Monitor Utility is used to monitor the status of redundant COM mode connections. The utility is designed for use with Windows 95/98/ME/NT/2000/XP/2003/Vista.

- Click the INSTALL Monitor Utility button in the CN2600 Installation CD auto-run window to install the NPort Monitor Utility. Once the installation program starts running, click **Yes** to proceed.
- 2. Click **Next** when the Welcome screen opens to proceed with the installation.

3. Click **Next** to install program files to the default directory, or click **Browse** to select an alternate location.

| 🕞 Setup - NPort Monitor Utility 📃 🗖 🔀  |

6. Click Finish to complete the installation of the NPort Monitor Utility.

## **Using the NPort Monitor Utility**

After you install the NPort Monitor Utility, you can monitor the status of the IP address and MAC address for redundant LAN 1, and also for redundant LAN 2.

- 1. Go to **Start > NPort Monitor Utility** to start the monitor utility.
- 2. Click the **Search** icon.

|  |       |                | LAN1           |              |                      |   |              |  |
|  |       |                | LAN2           |              |                      |   |              |  |
|  |       |                | LAN1           |              |                      |   |              |  |
|  |       |                | LAN2           |              |                      |   |              |  |
|  |       |                |                |              |                      |   |              |  |
|  |       |                |                |              |                      |   |              |  |
|  |       |                |                |              |                      |   |              |  |
|  |       |                |                |              |                      |   |              |  |

 The status will be listed as On Line, which means that all of the port numbers with LAN 1 and LAN 2 IP addresses will appear on the page.

If your maximum connections is 2, the monitor's connection 2 will show the LAN IP address.

## **Linux Real TTY Drivers**

#### **Basic Procedures**

Follow these instructions to map a CN2600 serial port to a Linux host's tty port:

- 1. Set up the CN2600. After verifying that the IP configuration works and you can access the CN2600 (by using ping, telnet, etc.), configure the desired serial port on the CN2600 to Real COM mode.
- 2. Install the Linux Real tty driver files on the host.
- 3. Map the NPort serial port to the host's tty port.

Follow these steps to add additional servers as needed:

**Step 1:** Modify "npreal2d.cf" file to add an additional server, or to remove unused servers. Users can use vi or any edit to modify it. It's a text file.

For more configuration information, take a look at the npreal2d.cf file.

- Step 2: Find the process id (PID) of program "npreal2d".# ps -ef | grep npreal2d
- **Step 3:** Update configuration of moxattyd program.

# kill -USR1 PID (ex. if "npreal2d" PID = 404, "kill -USR1 404")

#### ATTENTION

Please use the "mxaddsvr" to generate a temporary file for npreal2d.cf and follow the temporary file to modify "npreal2d.cf" if user don't know how to modify the "npreal2d.cf" file .

#### **Hardware Setup**

Before proceeding with the software installation, make sure you have completed the hardware installation. Note that the default IP address for the CN2600 is **192.168.127.254**.

#### NOTE

After installing the hardware, you must configure the operation mode of the serial port on your CN2600 to Real COM mode.

#### NOTE

Only CN2600-2AC V4.2 (firmware version 4.2 or later) supports Redundant COM Mode.

## **Installing Linux Real TTY Driver Files**

- 1. Obtain the driver file from the included CD-ROM or the MOXA website, at http://www.moxa.com.
- 2. Log in to the console as a super user (root).
- 3. Execute cd / to go to the root directory.
- 4. Copy the driver file **npreal2xx.tgz** to the **/** directory.
- 5. Execute tar xvfz npreal2xx.tgz to extract all files into the system.
- 6. Execute /tmp/moxa/mxinst.

For RedHat AS/ES/WS and Fedora Core1, append an extra argument as follows:

# /tmp/moxa/mxinst SP1

The shell script will install the driver files automatically.

- 7. After installing the driver, you will be able to see several files in the /usr/lib/npreal2/driver folder:
  - > mxaddsvr (Add Server, mapping tty port)
  - > mxdelsvr (Delete Server, un-mapping tty port)
  - > mxloadsvr (Reload Server)
  - > mxmknod (Create device node/tty port)
  - > mxrmnod (Remove device node/tty port)
  - > **mxuninst** (Remove tty port and driver files)
  - At this point, you will be ready to map the terminal server serial port to the system tty port.

#### **Mapping TTY Ports**

#### **Real COM Mode**

Make sure to set the operation mode of the desired CN2600 serial port to Real COM mode. After logging in as a super user, enter the directory **/usr/lib/npreal2/driver** and then execute **mxaddsvr** to map the serial port on the target terminal server to the host tty ports. The syntax of the **mxaddsvr** command is as follows:

mxaddsvr [Terminal Server IP Address] [Total Ports] ([Data port] [Cmd port])

The **mxaddsvr** command performs the following actions:

- 1. Modifies npreal2d.cf.
- 2. Creates tty ports in directory /dev with major & minor number configured in npreal2d.cf.
- 3. Restarts the driver.

#### **Mapping TTY Ports Automatically**

To map tty ports automatically, you may execute **mxaddsvr** with just the IP address and number of ports, as in the following example:

# cd /usr/lib/npreal2/driver
# ./mxaddsvr 192.168.3.4 16

In this example, 16 tty ports will be added, all with IP 192.168.3.4, with data ports from 950 to 965 and command ports from 966 to 981.

#### **Mapping TTY Ports Manually**

To map tty ports manually, you may execute **mxaddsvr** and manually specify the data and command ports, as in the following example:

```
# cd /usr/lib/npreal2/driver
# ./mxaddsvr 192.168.3.4 16 4001 966
```

In this example, 16 tty ports will be added, all with IP 192.168.3.4, with data ports from 4001 to 4016 and command ports from 966 to 981.

#### **Redundant COM Mode**

Before mapping the tty ports, you must set the operation mode of your NPORT to Redundant COM Mode (for npreal2\_1.17\_Build\_11011413.tgz or later only).

The following is a new command for mapping tty ports to Redundant COM Mode.

#### **Mapping TTY Ports**

mxaddsvr -r [NPort IP1 Address] [NPort IP2 Address] [Total Ports]

Example :

```
# cd /usr/lib/npreal2/driver
# ./mxaddsvr -r 192.168.32.134 192.168.126.123 16
```

In this example, 16 tty ports will be added, all with

```
IP1 192.168.32.134 and IP2 192.168.32.126, but with data ports equal to (950, 951, ..., 965), and command ports equal to (966, 967, 968, ..., 981).
```

#### **Removing Mapped TTY Ports**

There are two ways to remove mapped tty ports:

Remove mapped tty ports automatically: after logging in as root, enter the directory "/usr/lib/npreal2/driver" and then execute "mxdelsvr" to delete a server. The syntax of "mxdelsvr" is:

mxdelsvr [IP] ; For Real COM mode. mxdelsvr [IP1] ; For Redundant COM mode.

Example:

# cd /usr/lib/npreal2/driver
# ./mxdelsvr 192.168.3.4

If you do not include the IP address in the command line, a numbered list of IP addresses for servers currently installed, along with the total number of ports for each server, will be listed on the screen.

To remove the tty ports for a particular server, type the number next to the server's IP address and then hit Enter. The following tasks will be performed:

- Modify the npreal2d.cf
- Remove the relevant tty ports in directory "/dev"
- Stop and then restart the driver.

Remove mapped tty ports manually: after entering the directory "/usr/lib/npreal2/driver", you can modify "npreal2d.cf" to delete servers and ports manually, and then execute "mxloadsvr" to activate the modifications.

### **Removing Linux Driver Files**

A utility is included that will remove all driver files, mapped tty ports, and unload the driver. To do this, you only need to enter the directory **/usr/lib/npreal2/driver**, then execute **mxuninst** to uninstall the driver. This program will perform the following actions:

- 1. Unload the driver.
- 2. Delete all files and directories in /usr/lib/npreal2
- 3. Delete directory /usr/lib/npreal2
- 4. Modify the system initializing script file.

# **The UNIX Fixed TTY Driver**

### **Installing the UNIX Driver**

 Log in to UNIX and create a directory for the MOXA TTY. To create a directory named /usr/etc, execute the command:

#### # mkdir -p /usr/etc

 Copy moxattyd.tar to the directory you created. If you created the /usr/etc directory above, then execute the following commands:

# # cp moxattyd.tar /usr/etc # cd /usr/etc

3. Extract the source files from the tar file by executing the command:

# tar xvf moxattyd.tar

The following files will be extracted:

| README.TXT  |                             |
|-------------|-----------------------------|
| moxattyd.c  | source code                 |
| moxattyd.cf | an empty configuration file |
| Makefile    | makefile                    |
| VERSION.TXT | fixed tty driver version    |
| FAQ.TXT     |                             |

4. Compile and Link

For SCO UNIX: # make sco

For UnixWare 7:

```
# make svr5
```

For UnixWare 2.1.x, SVR4.2:

# make svr42

### **Configuring the UNIX Driver**

#### Modify the configuration:

The configuration used by the **moxattyd program** is defined in the text file **moxattyd.cf**, which is in the same directory that contains the program **moxattyd**. You may use **vi**, or any text editor to modify the file, as follows:

#### ttyp1 192.168.1.1 950

For more configuration information, view the file **moxattyd.cf**, which contains detailed descriptions of the various configuration parameters.

#### NOTE

The "Device Name" depends on the OS. See the Device Naming Rule section in README.TXT for more information.

To start the moxattyd daemon after system bootup, add an entry into **/etc/inittab**, with the tty name you configured in **moxattyd.cf**, as in the following example:

ts:2:respawn:/usr/etc/moxattyd/moxattyd -t 1

#### **Device naming rule**

For UnixWare 7, UnixWare 2.1.x, and SVR4.2, use:

**pts**/[n]

For all other UNIX operating systems, use:

ttyp[n]

#### Starting moxattyd

Execute the command **init q** or reboot your UNIX operating system.

#### Adding an additional server

- Modify the text file moxattyd.cf to add an additional server. The user can use vi or any text editor to modify the file. For more configuration information, look at the file moxattyd.cf, which contains detailed descriptions of the various configuration parameters.
- 2. Find the process ID (PID) of the program **moxattyd**.
  - # ps -ef | grep moxattyd
- Update configuration of moxattyd program.
   # kill -USR1 [PID] (e.g., if moxattyd PID = 404, kill -USR1 404)

This completes the process of adding an additional server

# **Overview**

If you want to remote control your serial devices on an Android platform, then the MxNPortAPI is a simple application programming tool that you can use. The MxNPortAPI helps programmers develop an Android application to access the device server by TCP/IP.

The MxNPortAPI provides frequently used serial command sets like port control, input/output, etc., and the style of developed Android application is similar to MOXA Driver Manager. For more details of the provided functions, please refer the "MxNPortAPI Function Groups" section.

This MxNPortAPI is layered between the Android application and Android network manager framework. This Android library is compatible with Java 1.7, Android 3.1 (Honeycomb - API version 12), and later versions.

|   | ication<br>acts, Camera) |
|---|--------------------------|
| Java API                                | MxNPortAP                |
| 100000000000000000000000000000000000000 | eworks<br>ge, Location)  |
| Libraries                               | Dalvik<br>Runtime        |
| Linux                                   | Kernel                   |

### How to Start MxNPortAPI

You can download the MxNPortAPI from Moxa's website at <u>http://www.moxa.com</u>, and develop the application program in popular OSs, such as Windows, Linux, or Mac.

(You can refer to the Android studio website to see the system requirements for development environment: <a href="https://developer.android.com/studio/index.html?hl=zh-tw#Requirements">https://developer.android.com/studio/index.html?hl=zh-tw#Requirements</a>).

To start your application program, please unzip the MxNPortAPI file and refer to the index (.html) under the Help directory.

# **MxNPortAPI Function Groups**

The supported functions in this API are listed below:

| Port Control | Input/Output | Port Status Inquiry | Miscellaneous |
|--------------|--------------|---------------------|---------------|
| open         |              |                     |               |
| close        |              | getBaud             |               |
| setIoctlMode |              | getFlowCtrl         |               |
| setFlowCtrl  | read         | getIoctlMode        | setBreak      |
| setBaud      | write        | getLineStatus       | Seldreak      |
| setRTS       |              | getModemStatus      |               |
| setDTR       |              | getOQueue           |               |
| flush        |              |                     |               |

# **Example Program**

To make sure this API is workable with the device server on an Android platform, see the example program below:

```
Thread thread = new Thread()
```

```
{
```

@Override

public void run() {

/\* Enumerate and initialize NPorts on system \*/

List<MxNPort> NPortList = MxNPortService.getNPortInfoList();

if(NPortList!=null){

MxNPort.IoctlMode mode = new MxNPort.IoctlMode();

mode.baudRate = 38400;

mode.dataBits = MxNPort.DATA\_BITS\_8;

mode.parity = MxNPort.PARITY\_NONE;

mode.stopBits = MxNPort.STOP\_BITS\_1;

MxNPort mxNPort = NPortList.get(0); /\* Get first NPort device \*/

```
try {
```

}

byte[] buf = {'H','e','l','l','o',' ','W','o','r','l','d'};

mxNPort.open(); /\*open port\*/

mxNPort.setIoctlMode(mode); /\*serial parameters setting\*/ mxNPort.write(buf, buf.length); /\*write data\*/

mxNPort.close(); /\*close port\*/

```
} catch (MxException e){
```

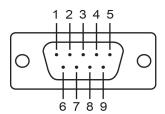

/\*Error handling\*/

} };

```
thread.start();
```

Simple Network Management Protocol agent software is built into the CN2600. The software supports cold/warm start trap, line up/down trap, and RFC 1213 MIB-II. The following table lists the standard MIB-II groups, as well as the variable implementations for the CN2600.

#### Supported SNMP variables

| System MIB  | Interfaces MIB    | ІР МІВ                  | ІСМР МІВ             |
|-------------|-------------------|-------------------------|----------------------|
| SysDescr    | itNumber          | ipForwarding            | IcmpInMsgs           |
| SysObjectID | ifIndex           | ipDefaultTTL            | IcmpInErrors         |

|         |                   | snmpOutTraps          |                         |
|         |                   | snmpEnableAuthenTraps |                         |

For the SNMP traps, refer to the OIDs and settings of the MIB-II file below.

- 1. Cold start: 1.3.6.1.6.3.1.1.5.1
- 2. Warm start: 1.3.6.1.6.3.1.1.5.2
- 3. Ethernet link down: 1.3.6.1.6.3.1.1.5.3
- 4. Authentication fail: 1.3.6.1.6.3.1.1.5.5

For the DCD/DSR changes, the OIDs are:

DCD UP

- ifIndex: 2 (port number)
- ifDescr: "Moxa serial port 2 DCD"

DCD Down

- OID: 1.3.6.1.6.3.1.1.5.3
- ifIndex: 2 (port number)
- ifDescr: "Moxa serial port 2 DCD"

DSR UP

- OID: 1.3.6.1.6.3.1.1.5.4
- ifIndex: 2 (port number)
- ifDescr: "Moxa serial port 2 DSR"

#### DSR Down

- OID: 1.3.6.1.6.3.1.1.5.3
- ifIndex: 2 (port number)
- ifDescr: "Moxa serial port 2 DSR"

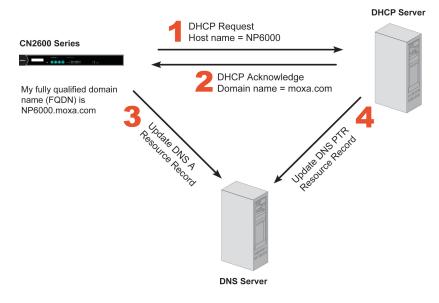

# C. Dynamic Domain Name Server

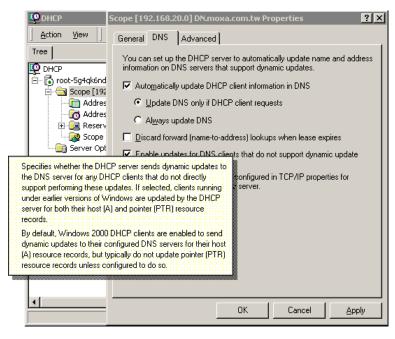

This appendix explains how to use the CN2600 with DDNS. When the CN2600 receive its IP address from a DHCP (Dynamic Host Configuration Protocol) server, remote servers will be unable to access it using a fixed IP address. With DDNS (Dynamic Domain Name Server), a remote server can access the CN2600 using its domain name instead of its IP address.

### **Overview**

The following is a summary of the process:

- 1. The CN2600 sends a request for an IP address to the DHCP server. At the same time, it notifies the DHCP server of its desired server name (CN2600 in the illustration) according to the option 12 standard.
- 2. The DHCP server replies with the IP address that is assigned to the CN2600, along with the domain name ("moxa.com" in the illustration) and the IP addresses for the DNS server and gateway.
- 3. If the CN2600 has authorization to update the DNS server, it will register its FQDN (Fully Qualified Domain Name) with the DNS server. The CN2600's FQDN will be in the format server name.domain name (CN2600.moxa.com" in the illustration).
- If the CN2600 is not authorized to update the DNS server, the DHCP server can be used to update the DNS server. The DHCP server will register the DNS server with the PTR RR (the record of request for a domain name with IP address).

The above screenshot shows how DHCP can be set up to update the DNS.

Currently, the CN2600 supports DNS service as provided by DynDNS. For detailed information on this option, please visit <u>https://www.dyndns.com</u>.

DDNS (default=Disable):Use this field to enable or disable DDNS.

**Server address** (default=DynDns.org): Currently, DynDns.org is the only option available for Server address.

**Host name**: In this field, use the name that you created on www.dyndns.com. The CN2600 will update the DynDNS server with this host name.

**Username**: This is the user name used for update authentication.

**Password**: This is the password used for update authentication.

# **D. Well Known Port Numbers**

In this appendix, we provide a list of well known port numbers that may cause network problems if you set the CN2600 to one of these ports. Refer to RFC 1700 for well known port numbers or to the following introduction from the IANA:

The port numbers are divided into three ranges: the Well Known Ports, the Registered Ports, and the Dynamic and/or Private Ports.

The Well Known Ports range from 0 through 1023.

The Registered Ports range from 1024 through 49151.

The Dynamic and/or Private Ports range from 49152 through 65535.

The Well Known Ports are assigned by the IANA, and on most systems, can only be used by system processes or by programs executed by privileged users. The following table shows famous port numbers among the listed well-known port numbers. For more details, please visit the IANA website at <a href="http://www.iana.org/assignments/port-numbers">http://www.iana.org/assignments/port-numbers</a>.

| TCP Socket | Application Service                   |  |
|------------|---------------------------------------|--|
| 0          | Reserved                              |  |
| 1          | TCP Port Service Multiplexer          |  |
| 2          | Management Utility                    |  |

Managing diverse serial lines and modem pools for large numbers of users creates the need for significant administrative support. Since modem pools are links to the outside world, careful attention must be paid to security, authorization, and accounting. This can best be achieved by managing a single database of users allowing authentication (verifying user names and passwords) as well as configuration of information that details the type of service to deliver to the user (e.g. SLIP, PPP, Telnet, and rlogin). The CN2600 supports the RADIUS protocol, which requires only one database for remote user management.

# What is RADIUS?

### Definition

Remote Authentication Dial-up User Service, or RADIUS, is the standard for centralizing the authentication, authorization, and accounting of remote access users.

Here is a brief description of how RADIUS works: When a user dials in to a remote access device, that device communicates with the central RADIUS server to determine if the user is authorized to connect to the LAN. The RADIUS server performs the authentication and responds with the result—either accept or reject. If the user is accepted, the remote access server routes the user onto the network; if not, the server will terminate the user's connection. The RADIUS server also provides accounting services if supported by the remote access server.

With RADIUS, a network manager or ISP only needs to maintain a single, central database against which all remote user authentications take place. This greatly eases the management burden associated with administering a large number of dial-in users.

### **Client/Server Architecture**

RADIUS is a type of client-server software. Communication servers such as the CN2600 play an active role, whereas RADIUS servers are passive.

When a remote host is connected to the CN2600, the host is prompted to enter a user ID and password.

After receiving the user ID and password, the CN2600 sends the information to a defined RADIUS server. Up to this point, the remote user is still unable to access the network.

The RADIUS server compares the user ID and password with its internal database and responds through the network, either accepting or rejecting the connection attempt.

If the CN2600 receives the "accept" message from the RADIUS server, the remote user is allowed to access the network. Otherwise, the CN2600 will either terminate the connection or attempt to connect again after a specified duration of time.

# Setting up the CN2600

### Setting up the RADIUS Server IP Address

RADIUS server IP: This is the IP address of the RADIUS server.

RADIUS key: This is the password that is used to access the RADIUS server IUS server

**UDP port**: This is the RADIUS server's assigned UDP port.

RADIUS accounting: This field enables or disables RADIUS accounting.

### **Serial Port Configuration**

RADIUS is an effective authentication method for dial-up services. In addition to dial-up services (PPP, SLIP, and Dynamic), the CN2600 supports RADIUS settings for terminal applications and console management application. You will see it as an option for **Authentication type** when configuring the port's operation mode. Please refer to Chapter 7, *Configuring Serial Port Operation Mode*, for detailed information and configuration instructions

# **Setting up UNIX Hosts**

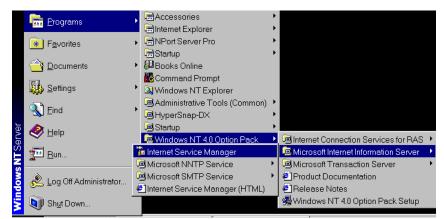

MOXA recommends the FreeRADIUS server for UNIX users. FreeRADIUS is the premiere open-source RADIUS server and is one of the top five RADIUS servers in use world-wide. It is effective for both embedded systems with small amounts of memory and for systems with millions of users. It is fast, flexible, and configurable, and it supports more authentication protocols than many commercial servers.

The server is released under the GNU General Public License (GPL), which means that it is free to download and install. FreeRADIUS can be downloaded from the following website:

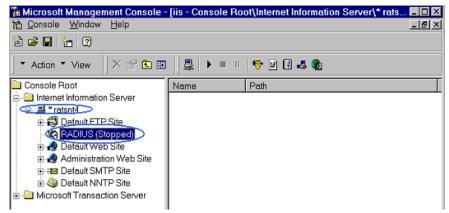

http://www.freeradius.com/

# **Setting up Windows NT Hosts**

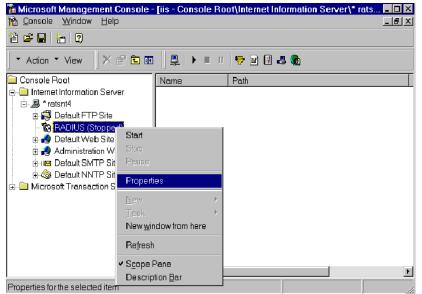

- 1. Install Windows NT OPTION PACK 4.0 on the Windows NT server.
- 2. Open Start > Programs > Windows NT 4.0 Option Pack > Microsoft Internet Information Server > Management Console Manger.

- 3. Go to Console **Root > Internet Information Server** (in the left pane). Your computer's name should be visible.
- 4. Find your computer's name in the left panel and click on it, after which you will see RADIUS in the right information window.

5. Right click **RADIUS** in the left information window, and then select **Properties**.

6. Select **Service**. Verify that the RADIUS ports assignments match your configuration.

[Authentication] 1645 or 1812 [Accounting] 1646 or 1813

 Select Client, and then click Add. Enter the CN2600's IP address in the IP address field. Enter the CN2600's RADIUS key in the password field. This must match the RADIUS key that you set in the CN2600 console.

# Setting up Windows 2003 Hosts

Windows 2003 uses the IAS service instead of the RADIUS service. For this reason, you need to install the IAS service to use RADIUS with Windows 2003 (The IAS service will not be installed by default).

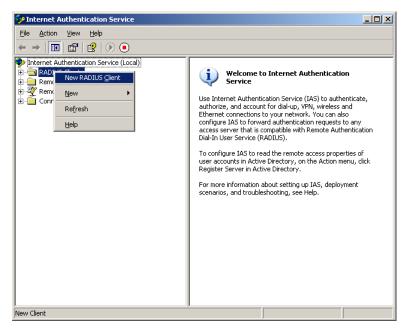

- 1. Open Start > Add or Remove Programs > Add/Remove Windows Components.
- 2. With Windows Components selected, choose Networking Services.

| Windows Components Wizard   | ×                |
|---|------------------|
| Windows Components<br>You can add or remove components of Windows.  | t                |
| To add or remove a component, click the checkbox. A shaded box me<br>part of the component will be installed. To see what's included in a con<br>Details. |                  |
| Components:   |                  |
| Management and Monitoring Tools   | 6.4 MB           |
| 🗹 🚔 Networking Services   | 2.6 MB           |
| 🔲 📇 Other Network File and Print Services   | 0.0 MB 🛄         |
| 🗆 🚐 Remote Installation Services  | 2.0 MB           |
| 🗆 👼 Bemote Storage  | 35 MB 🗾          |
| Description: Contains a variety of specialized, network-related services  | s and protocols. |
| Total disk space required: 17.2 MB  | Details          |
| Space available on disk: 1914.9 MB  |                  |
|   |                  |
| < <u>B</u> ack <u>N</u> ext > Cance   | Help             |

3. Select Details, and then select **Internet Authentication Service**. Continue clicking **OK** until the installation is complete.

4. After the installation is complete, click **Administrative Tools** and run the **Internet Authentication Service**. This will open the following window.

5. Select **New** RADIUS **Client** to add a new RADIUS client. You will then be able to begin using this function.

# F. CN2600 Series Comparison Table
