1. Introduction

The Moxa MXview One network management software consists of three parts: The Main Module, Power Add-on Module, and the Wireless Add-on Module. The Moxa MXview One network management software gives you a convenient graphical representation of your Ethernet network, and allows you to configure, monitor, and diagnose Moxa networking devices. MXview One provides an integrated management platform that can manage Moxa networking devices, such as Ethernet switches, wireless APs, SNMP-enabled, and ICMP-enabled devices installed on subnets. The MXview Power Add-on Module provides additional advanced functions for power substation applications and the MXview One Wireless Add-on Module provides additional advanced functions for wireless applications to monitor and troubleshoot your network, and help you minimize downtime.

Key Features

Web-based Operation

You will need to install the MXview One on a Windows computer connected to the network(s) that are to be managed. After installing MXview One, the network can be managed using Chrome, Firefox, or Microsoft Edge (version 79+), without installing additional software.

Auto Discovery and Topology Visualization

Within the Device Discovery, MXview One locates networking devices with SNMP or ICMP services enabled. MXview One can collect topology information from devices with LLDP capability and draw the topology of the network, which shows wired and wireless connections. For ICMP devices without LLDP, MXview One can verify the connection relationship through ARP algorithms, and help you create an accurate drawing of the network topology. If any managed PoE switches are in your network, the PoE power output information will also be visualized automatically.

Event Management

For troubleshooting purposes, MXview One logs events that match predefined conditions, such as link up/down, device unreachable, or traffic overloading. The most recent events will be displayed to inform users of the networking status. Devices and links that generate events will be highlighted with different colors. When an event occurs, users can be notified by email.

Configuration and Firmware Management

MXview One provides an interface for managing Moxa networking devices from a central location. Users can remotely backup or update configuration files, and upgrade firmware via MXview One.

Traffic Monitoring

MXview One can log the network traffic of network devices that have been discovered.

System Requirements

The computer that MXview One is installed on must satisfy the following system requirements:

	System Requirements
CPU	Quad-core CPU or better
RAM	16 GB or higher
Hard Disk Space	SSD 1 TB or higher
OS	<ul style="list-style-type: none">Windows 10, Windows 11 (64-bit) Windows Server 2016, Windows Server 2019, Windows Server 2022 (64-bit)Linux - Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04 <p>For the latest supported OS versions, please visit the MXview One website: https://www.moxa.com/en/products/industrial-network-infrastructure/network-management-software/mxview-one-series#resources</p>
Client Browser Requirements	Browser: Chrome: Version 76 or later Firefox: Version 69 or later Microsoft Edge: Version 79 or later

Supported Devices

MXview One supports a full range of functions, such as network status, traffic log, and configuration/firmware file management.

- For other SNMP-enabled devices, MXview One supports standard management functions, such as link up, link down, and SNMP MIBII information.
- MXview One can only monitor the connectivity of devices that support ICMP.

Please check the MXview One datasheet on moxa.com for a list of Moxa devices that are supported.

2. Installation and Uninstallation

Installation Procedure

For Windows

1. Execute the installation program.
2. During the installation, you can check the EULA (End-User License Agreement) and choose the directory in which MXview One will be installed and the default language, or leave the settings as the default values.
3. After the installation is complete, shortcuts for launching the MXview One server will be created on the desktop and in the start menu.

NOTE

If your computer already has MXview installed, please uninstall it and then start the MXview One program installation process.

For Ubuntu 20.04

For Ubuntu 20.04 installation instructions, please refer to the Readme.txt included in the MXview One Linux software package, which can be downloaded from the Moxa website.

There are two ways to install MXview One on **Ubuntu 20.04**: offline and online installation. We recommend installing MXview One using the **offline method first** to avoid any compatibility issues.

If you are unable to activate MXview One using the online installation method, install the software using the offline method.

For Ubuntu 18.04 and 22.04

For Ubuntu 18.04 and 22.04 installation instructions, please refer to the Readme.txt included in the MXview One Linux software package, which can be downloaded from the Moxa website.

MXview One can only be installed on **Ubuntu 18.04 and 22.04** using the online installation method.

Uninstallation

For Windows

1. Locate the **Control Panel** in Windows.
2. Under **Programs**, click **Uninstall a program**.
The **Uninstall or change a program** screen appears.
3. Select **MXview One**
4. Click **Uninstall** or **Uninstall/Change** at the top of the program list.

For Ubuntu

Execute the command line:

```
#sudo apt remove mxview
```

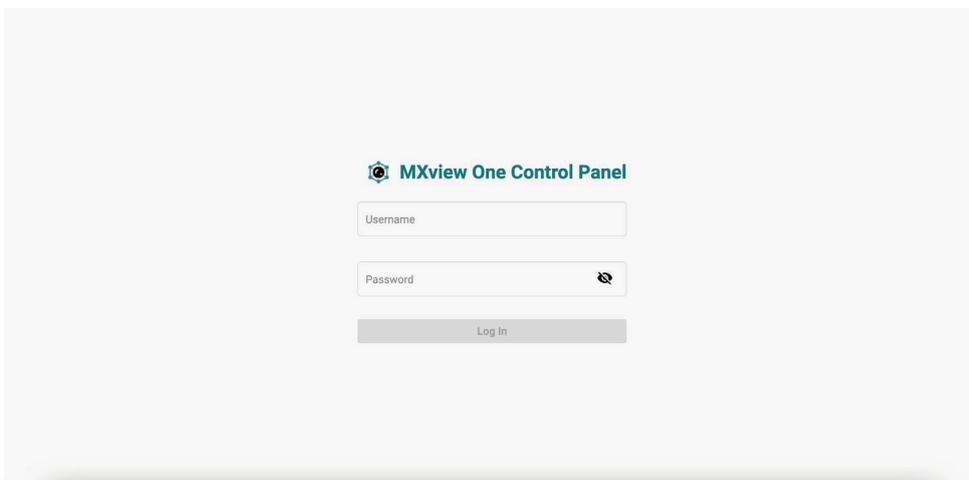

3. Getting Started

MXview One Control Panel

Server Control

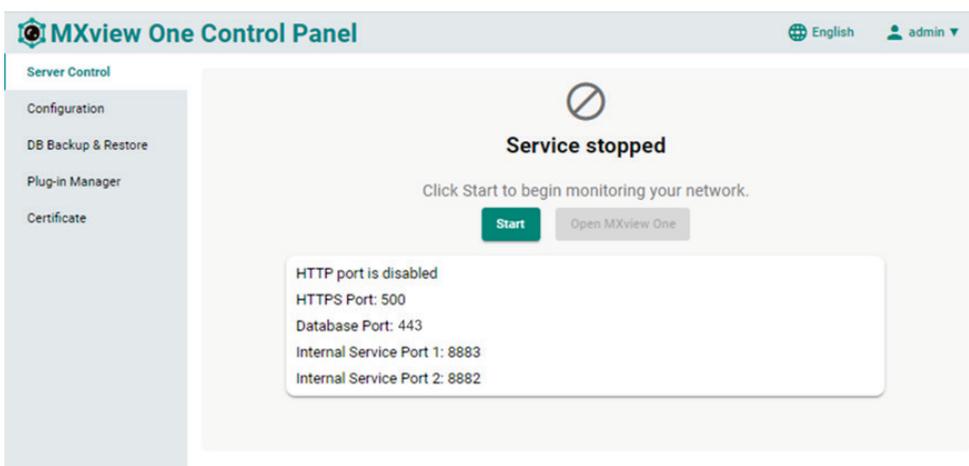

Start the MXview One server on the computer before launching the MXview One web console. On the server computer, double-click the MXview One desktop shortcut in the Windows operating system. For Ubuntu users, type in the local host IP address to open the page.

The MXview One Control Panel log in screen appears first and after logging in will direct to the Control Panel.

Provide the following login credentials

- **Username:** The default username is **admin**.
- **Password:** The default password is **moxa**.

If it is the first time you log in to the MXview One Control Panel, please change the default password to enhance security.

Login Notification

We strongly recommend that you change the default password to enhance security.

[Close](#) [Change](#)

Configuration

Configure the following port numbers in the **Configuration** Page:

The screenshot shows the MXview One Control Panel interface. On the left is a navigation menu with options: Server Control, Configuration (selected), DB Backup & Restore, Plug-in Manager, and Certificates. The main content area is titled 'MXview One Central Manager Server Settings' and contains the following fields:

- Enable ***: A dropdown menu with 'Yes' selected.
- Manage Licenses Through MXview One Central Manager ***: A dropdown menu with 'Yes' selected.
- Server Address ***: Two input fields. The first is labeled 'IP/Domain Name' and contains 'IP/Domain Name'. The second is labeled 'Port' and contains '8883'. Below the port field, the range '1-65535' is indicated.
- Authentication ***: A password input field containing 'Password' and a toggle icon. Below the field, it says 'At least 8 characters' and '0 / 63'.
- Site ID ***: An input field containing 'Site ID'.

MXview One Central Manager Server Settings

- **Enable**
 - **Yes:** This MXview One site will be managed through MXview One Central Manager. This requires the below MXview One Central Manager settings to be configured.
 - **No:** The MXview One site operates independently and cannot be managed through MXview One Central Manager.
- **Manage Licenses through MXview One Central Manager**
 - **Yes:** All the licenses of this MXview One site will be managed through MXview One Central Manager.
 - **No:** The licenses for this site are managed locally at the MXview One site.
- **Server Address**
 - **IP/Domain Name:** The IP address of MXview One Central Manager.
 - **Port:** The service port used to connect to MXview One Central Manager. The default port number is 8883.
- **Authentication**
 - **Password:** The password used to connect to MXview One Central Manager.
- **Site ID**
 - **Site ID:** This value represents the site ID as shown on the Site Management page in MXview One Central Manager.

Interface Settings

Web Interface

HTTPS * 1-65535

HTTP * 1-65535

Database Interface

Port * 1-65535

Password * At least 8 characters 8 / 63

Microservices Interface

Internal Service Port 1 * 1-65535 At least 8 characters 8 / 63

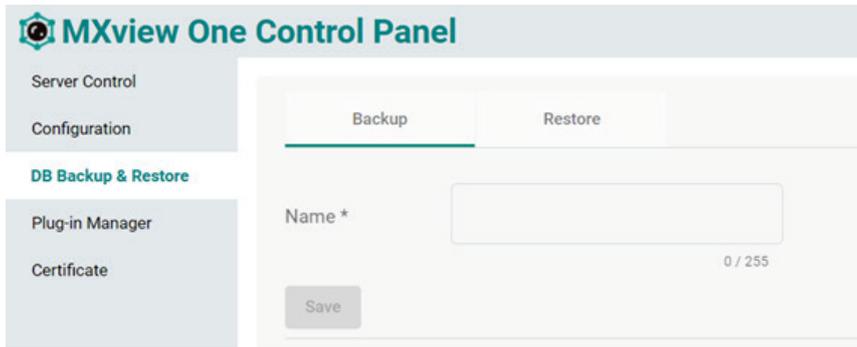

Internal Service Port 2 * 1-65535 At least 8 characters 8 / 63

- **Web Interface**
 - **HTTPS:** Specify the HTTPS port of the MXview One Central Manager server. The default port is 443.
 - **HTTP:** Enable or disable HTTP. If enabled, specify the listening port of the server. The default port is 80.
- **Database Interface**
 - **Port:** Specify the service port of the MXview One Central Manager database server. The default port is 5432.
 - **Password:** The password used to connect to MXview One Central Manager.
- **Microservices Interface**
 - **Internal Service Port 1/2:**
 - Port:** Specify the communication ports between MXview One and its internal system. The default ports are 8883 and 8882.
 - Password:** The password used for the microservices interface.

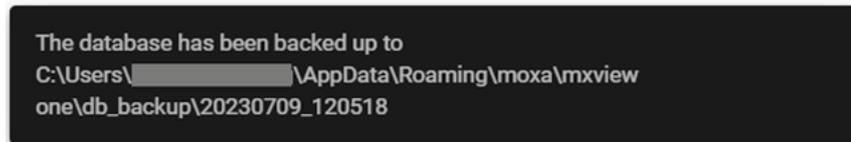

When finished, click **Save**.

DB Backup & Restore

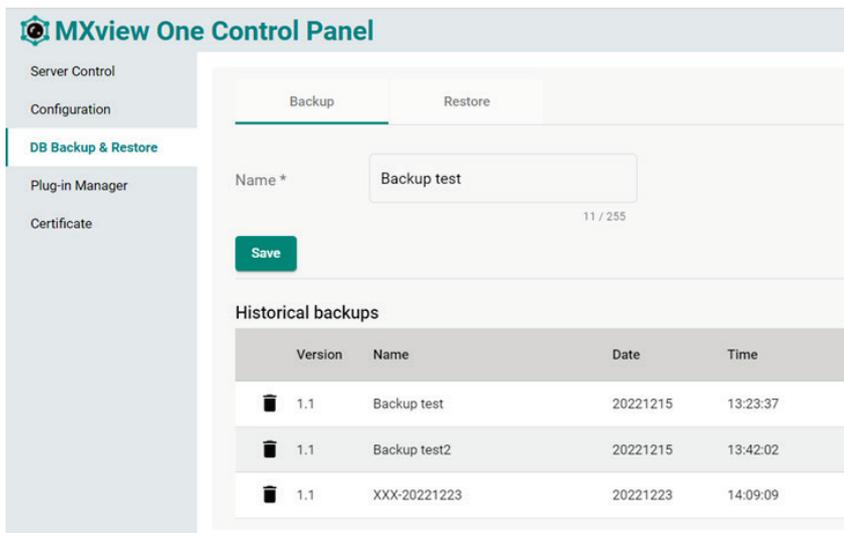

1. Navigate to **DB Backup & Restore** on the MXview One Control Panel.
The Database Backup & Restore screen will appear and includes **Backup** and **Restore** functions.

2. Choose the **Backup** tab to start the process of backing up the database.
3. In the **Name** field, specify the backup file name.
4. Click **Save**.
5. The message that the file of the backup database has been stored in the specified directory will be displayed.

6. When the database has been backed up successfully it will appear in the **Historical backups** list.

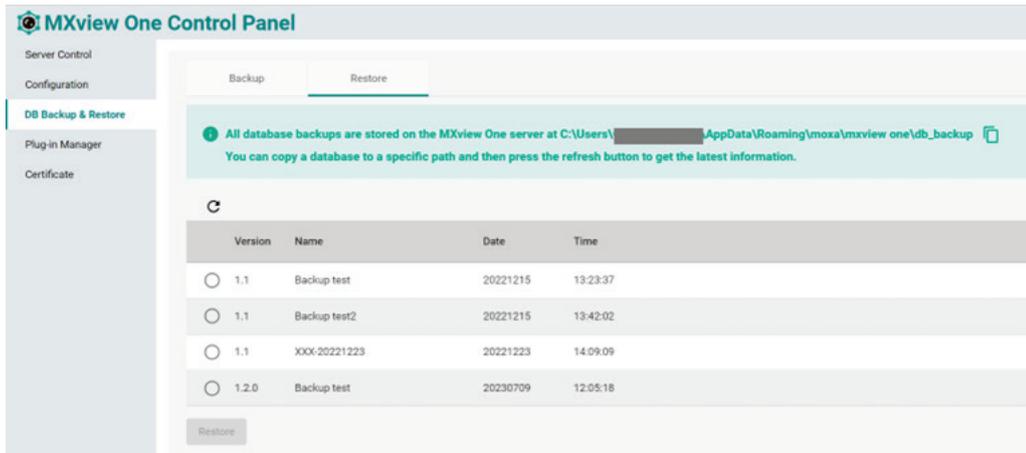

The system backup file includes the following items:

- Topology
- Traffic
- Availability
- Event
- Threshold settings
- Maintenance scheduler settings
- OID items
- Trap items
- System settings
- System Restore

The MXview One system will restore the system configurations from a backup file.

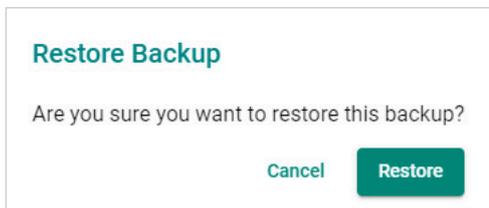

1. Click the **Restore** Tab.

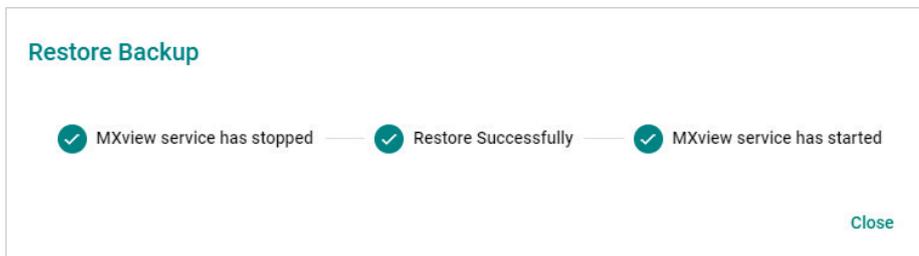

2. Choose the backups you want to restore in the table. You can also copy a database to a specific path and then press the refresh button to get the latest result.

3. Click **Restore**.

A confirmation screen will appear.

4. Displaying the restoration process.

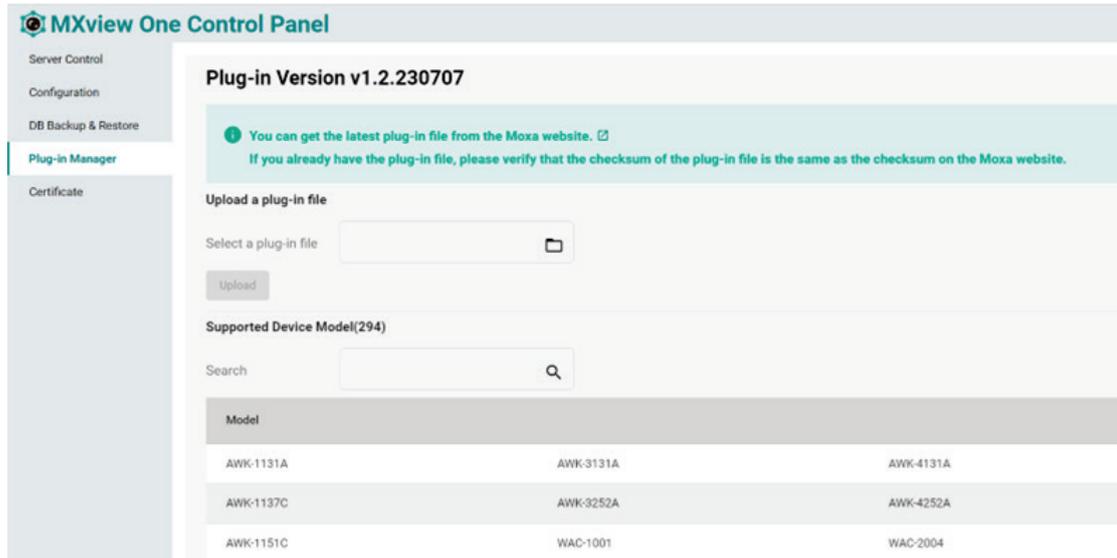

5. Click **Close**.

Plugin Manager

Navigate to **Plugin Manager** on the **Control Panel**. The Plugin Manager is a tool that can be used to manage the plugin files. When you discover a new Moxa product that has not been integrated in to the latest MXview One version, you may not be able to retrieve the product information from MXview One. To solve this, you can download the plugin file from Moxa's website, and then upload the file in the Plugin Manager. After uploading the plugin files, these new models can be supported by MXview One.

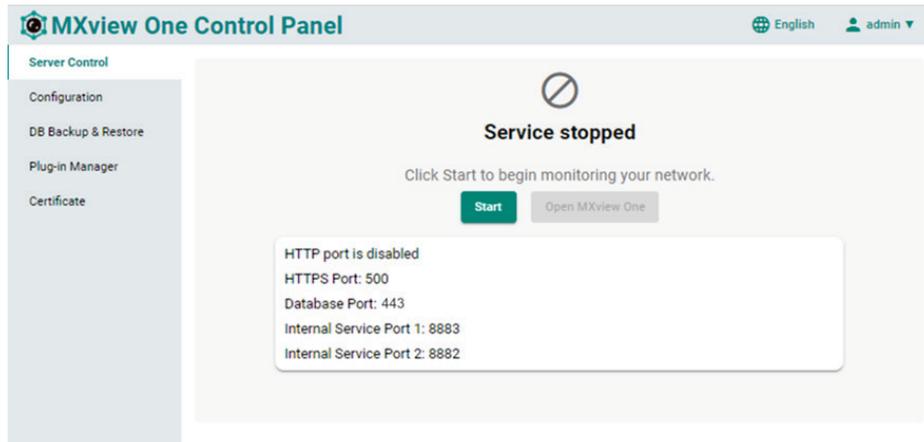

The **Plugin Manager** screen includes the following information:

- Plug-in file version
- Upload a Plug-in file
- Supported device model

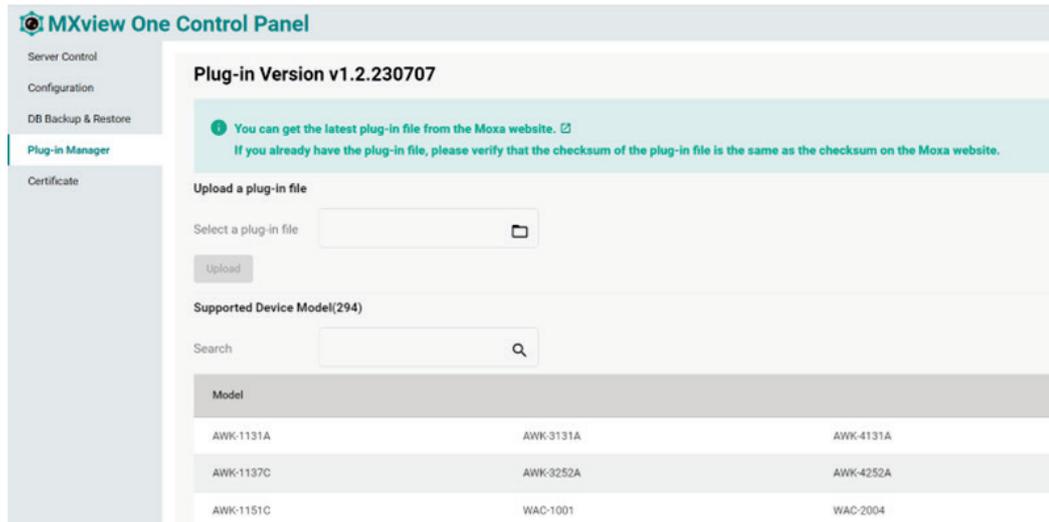

Steps to **Upload a Plug-in File**:

1. Stop MXview One.

2. Download the latest plug-in file from the Moxa website. <https://www.moxa.com/en/products/industrial-network-infrastructure/network-management-software/mxview-one-series#resources>

3. Navigate to the **Plugin Manager** on the **Control Panel**.

4. Click the folder () icon in **Select a Plug-in File** to upload the file (.zip) from your local machine.
5. Click **Upload** and if successful, the message below will be displayed.
MXview One will upload the plug-in file and display the supported devices.

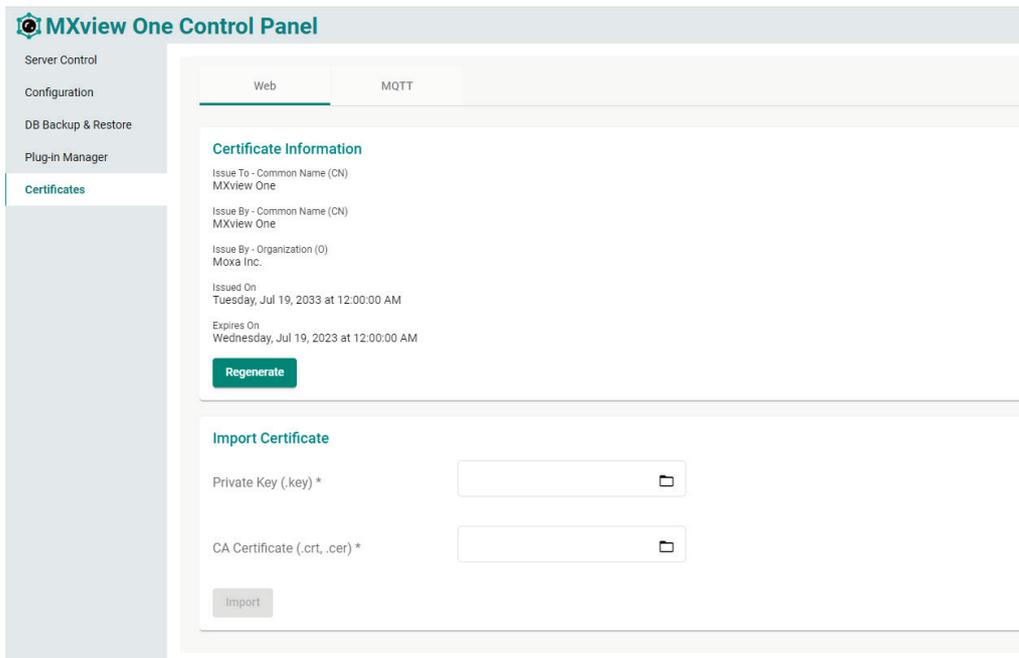

Certificates

From the **Certificate** page, you can view the certificates used by MXview One. By default, you can view information for **Web** certificates. If this MXview One instance is managed through MXview One Central Manager, an additional **MQTT** certificate tab will be available.

Web Certificates

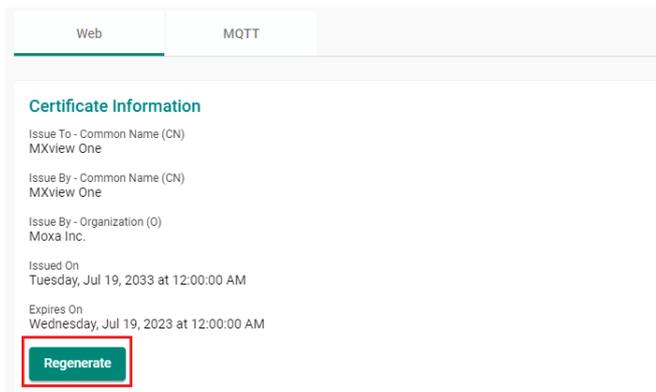

On the **Web** tab, you can view the information for the current web certificates, including:

- Issue To - Common Name (CN)
- Issue By - Common Name (CN)
- Issue By - Organization (O)
- Issued On
- Expires On

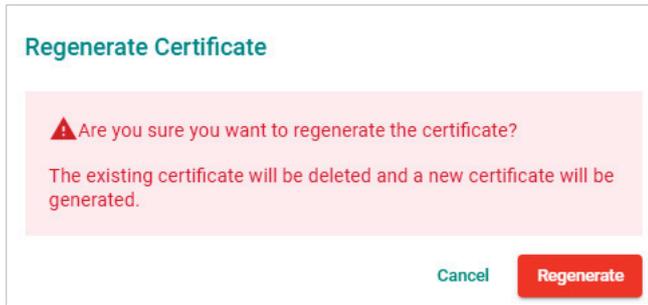

Regenerating the Certificate

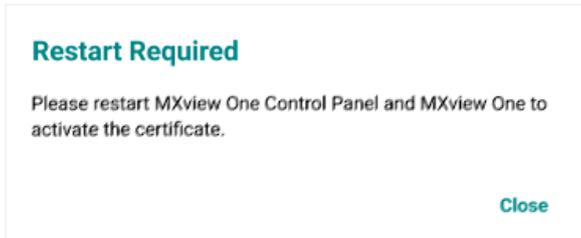

1. Click the **Regenerate** button.
The **Regenerate Certificate** window will appear.

2. Click **Regenerate** to regenerate the certificate.

3. After successfully regenerating the certificate, MXview One Central Manager Control Panel will need to be restarted for the certificate to take effect. Click Close and restart the instance.

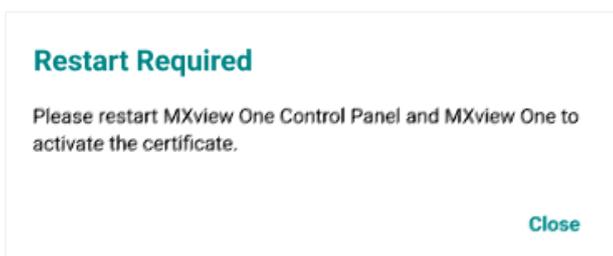

Importing a Certificate

You can manually import a certificate file and key file.

1. Click the folder icon for the Private Key and CA Certificate fields and navigate to the certificate (.crt, .cer) and key (.key) file on the local host.

2. Click **Import**.
3. After successfully importing the certificate, MXview One Control Panel will need to be restarted for the certificate to take effect. Click **Close** and restart the instance.

MQTT Certificates

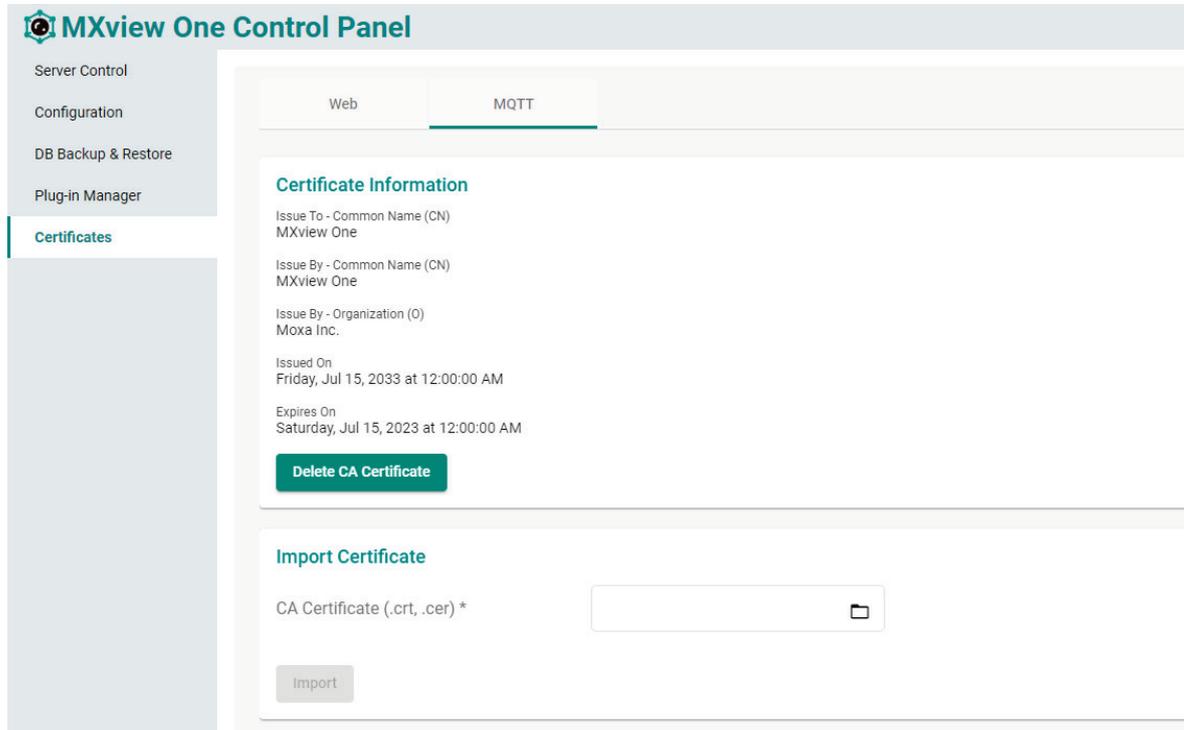

NOTE

By default, no MQTT certificate will be available. To view MQTT certificate information, import the CA Certificate generated through MXview One Central Manager. Refer to [Importing the MXview One Central Manager CA Certificate](#).

If this MXview One instance is managed through MXview One Central Manager, the MQTT tab will be available. On the **MQTT** tab, you can view the information for the current MQTT certificates, including:

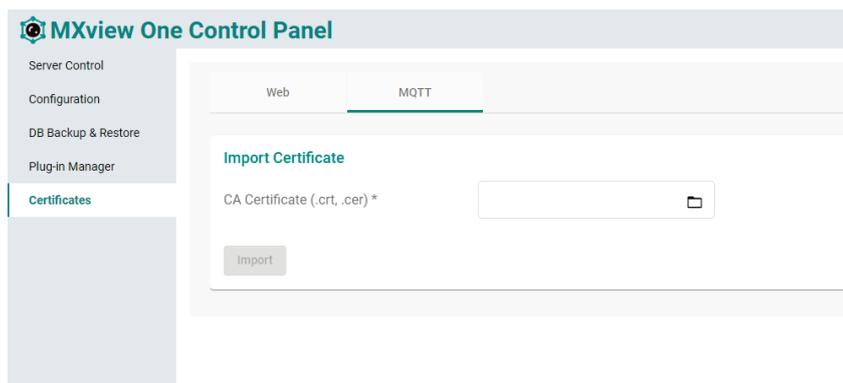

- Issue To - Common Name (CN)
- Issue By - Common Name (CN)
- Issue By - Organization (O)
- Issued On
- Expires On

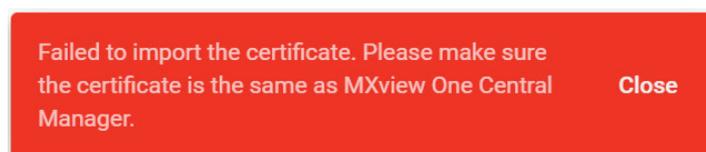

Importing the MXview One Central Manager CA Certificate

If this MXview One instance is managed through MXview One Central Manager, upload the CA certificate generated through MXview One Central Manager Control Panel here.

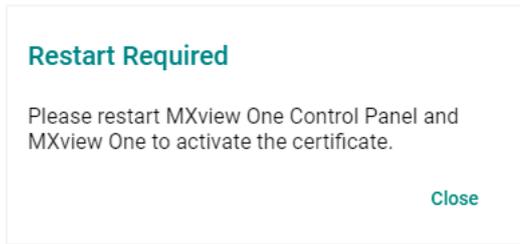

1. Click the folder icon for the CA Certificate field and navigate to the certificate file generated through MXview One Central Manager Control Panel on the local host.

If the uploaded certificate is not from Central Manager, an error message will appear.

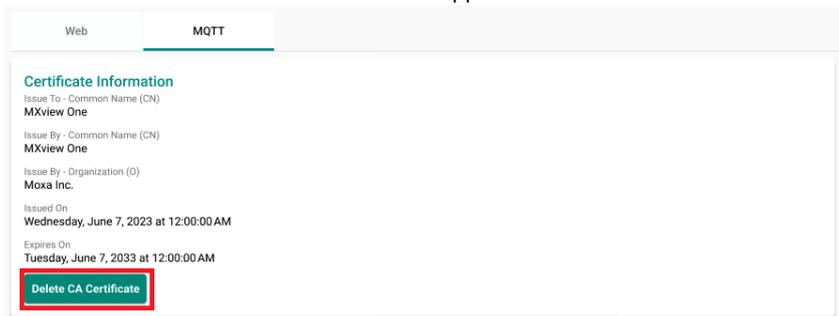

2. Click **Import**.
3. After successfully importing the certificate, MXview One Control Panel will need to be restarted for the certificate to take effect. Click **Close** and restart the instance.

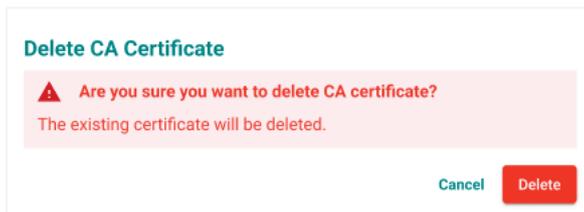

Deleting the CA Certificate

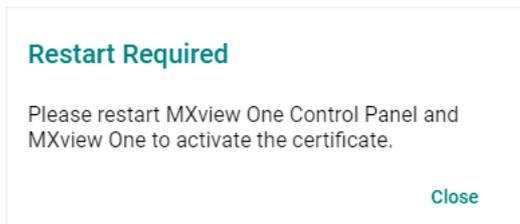

1. Click **Delete CA Certificate** to delete the current CA certificate file. The **Delete CA Certificate** window will appear.

2. When prompted, click **Delete**.

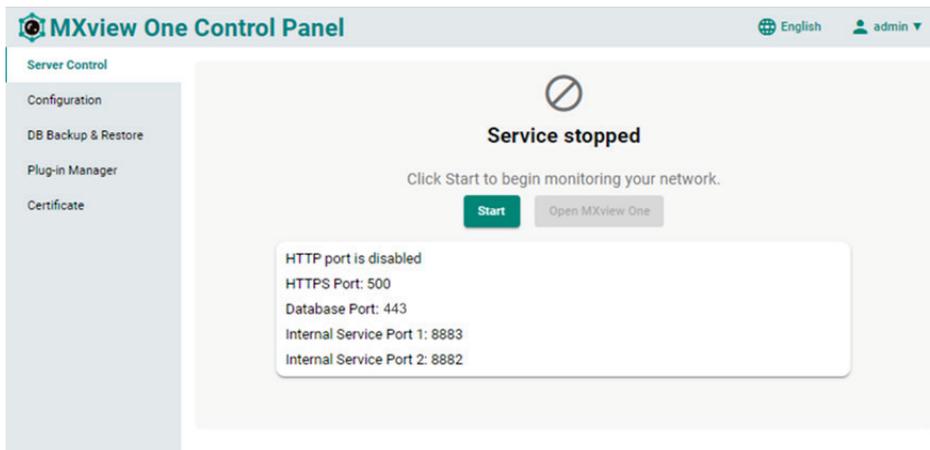

3. After successfully deleting the certificate, MXview One Control Panel will need to be restarted for the certificate to take effect. Click **Close** and restart the instance.

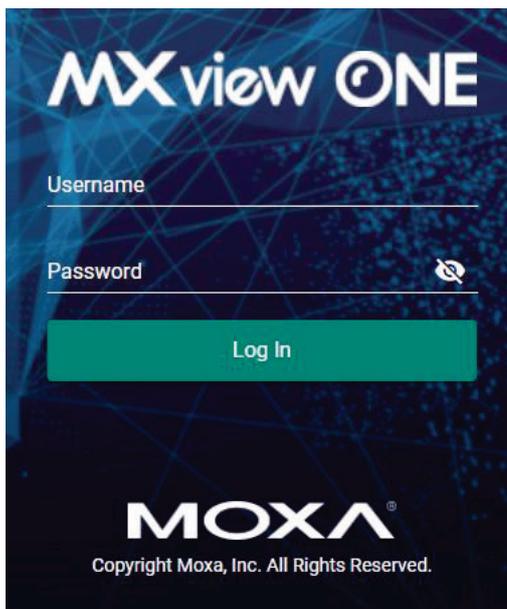

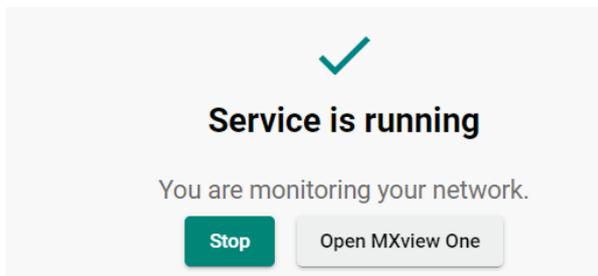

Starting the MXview One Server and Logging Into MXview One

1. Click **Start** on the Server Control page. The MXview One server will start running.

2. Wait for the status to display **Service is running**, then click **Open MXview One** and log in to MXview One:

Provide the following login credentials

- **Username:** The default username is **admin**.
- **Password:** The default password is **moxa**.

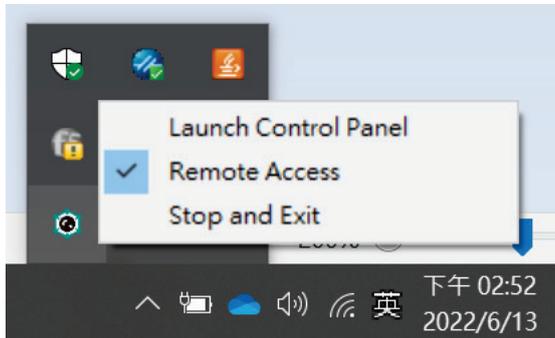

NOTE

Alternatively, you can log in to MXview One from a computer located remotely after starting the MXview One service. For more information, see **Logging Into MXview One Remotely**.

Logging Into MXview One Remotely

You can log in remotely to MXview One that is installed on your local site computer from another computer.

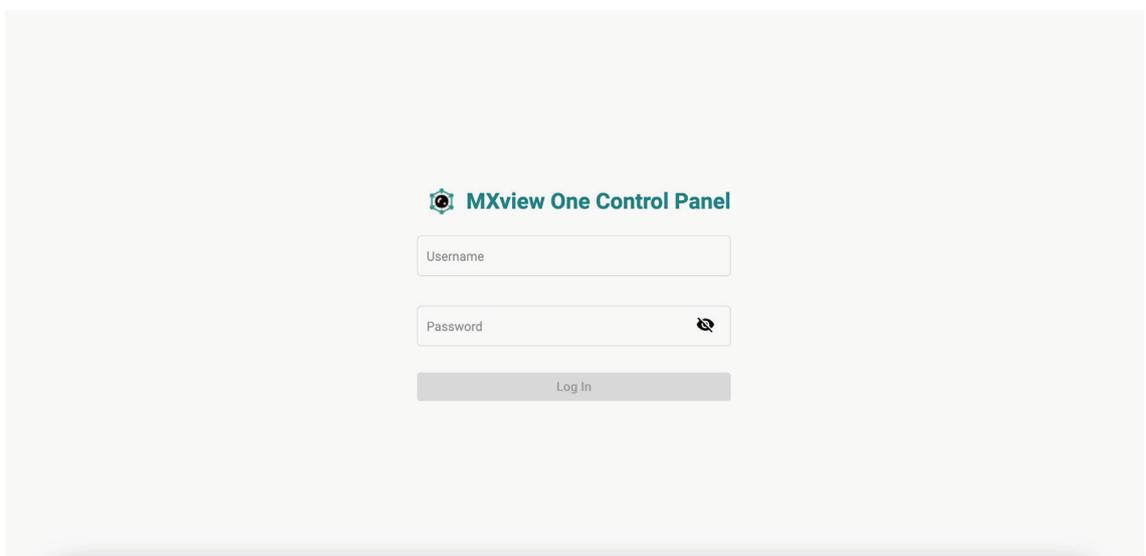

1. Launch the MXview One server at the local site computer. Go to the tool bar and click the MXview One icon. Select **Remote Access**.

NOTE

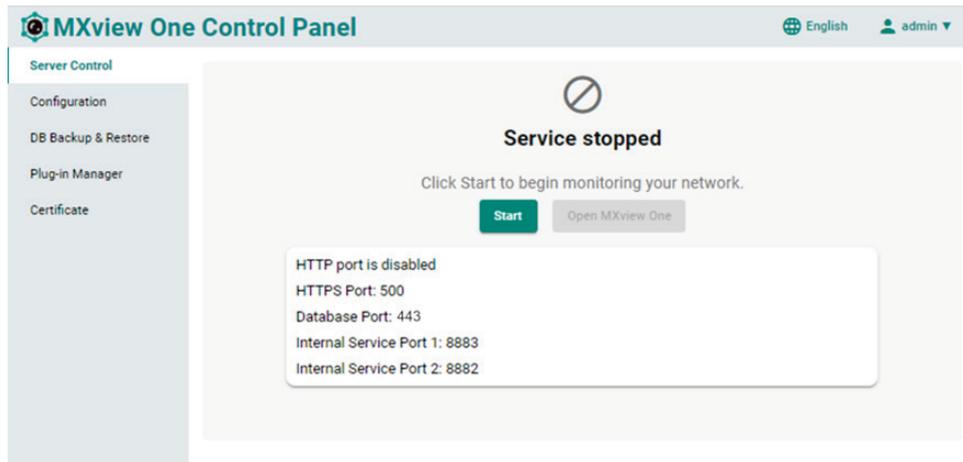

If you want to close the remote function, just click Remote Access again, then the function will be closed.

2. Open a web browser on the computer located at the remote site.
3. In the address bar, input the IP address or domain name of the computer that you want to log in to MXview One from.
 - Format: **https://[IP address]:[Port]**
 - Example: **https://192.168.1.250:7100**The MXview One Control Panel appears.

4. Provide the following login credentials
 - **Username:** The default username is **admin**.
 - **Password:** The default password is **moxa**.
5. You can choose one of the actions listed below:
 - Click the Start button
 - Click the Stop button

- Change the configurations on the Configuration page

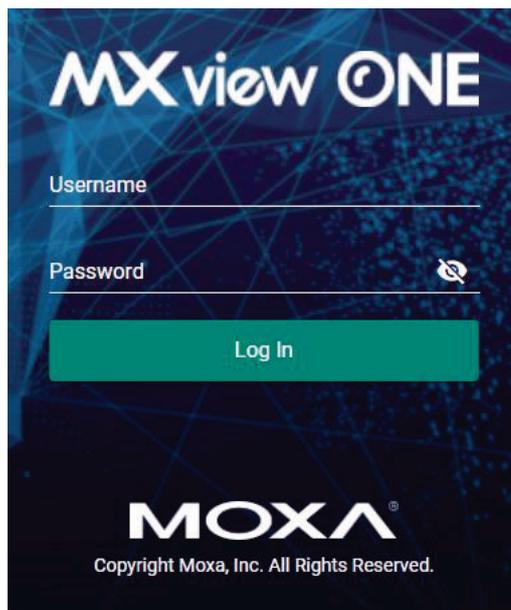

6. To open the MXview One web console, you can type the IP address of the computer at the local site into another web browser once the MXview One Control Panel displays 'Service is running now'.

- Format: **https://[IP address]**
- Example: **https://192.168.1.250**

The MXview One web console appears.

7. Provide the following login credentials
 - **Username:** The default username is **admin**.
 - **Password:** The default password is **moxa**.

NOTE

A maximum of 10 users can log in to MXview One web console at the same time.

License Management

You can monitor your devices inside the networking status via MXview One. Please note, in order to monitor the devices, you need to activate the Node-based license. For example, if you activate 123 nodes in MXview One, then during the device discovery MXview One will only recognize up to 123 nodes. MXview One will stop the device discovery process once it reaches the 123-node limit.

To increase the node limit, you can purchase additional licenses and import the license into MXview One.

NOTE

Click "Start Trial" to start using MXview One.

Checking the License

The **License Management** screen displays information about your MXview One license, including the number of licensed nodes, nodes currently in use, and application license. You can also use the **License Management** screen to add a new license or deactivate an existing license.

To access the **License Management** screen, navigate to **Menu** (☰) > **Administration** > **License Management**.

License Management

Adding a New License

To increase the node limit of your MXview One server, you need to add the node-based license.

1. Navigate to **Menu** (☰) > **Administration** > **License Management**.
The **License Management** screen appears.
In the **Add New License** section, click **Add New License**.
2. Login to the Moxa License Site to activate the MXview One license. Click **Next** to get the User Code.

Add New License

1 — 2 — 3

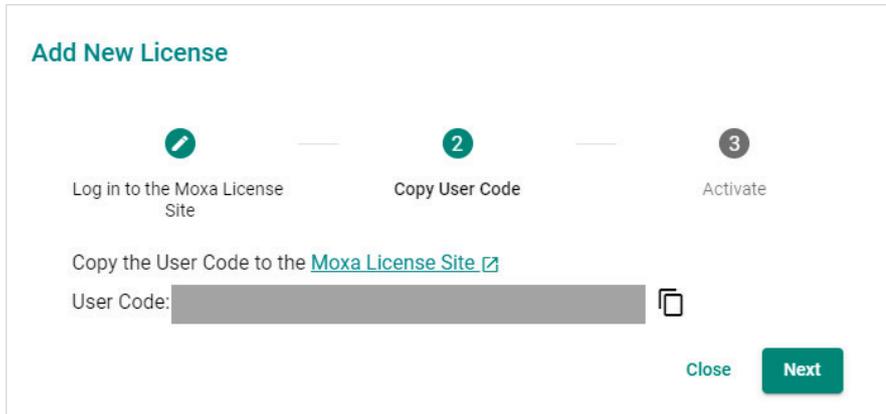

Log in to the Moxa License Site Copy User Code Activate

1. Log in to the [Moxa License Site](#) 🔗
2. Choose "Activate a Product License" and "MXview One" on the site.
3. Registration Code

Your registration code (Type: MXview One NEW)
(Model name: LIC-MXviewOne-NEW-XN-SR) is
xxxxxxxxxxxxxxxxxxxxxxxxxxxxx

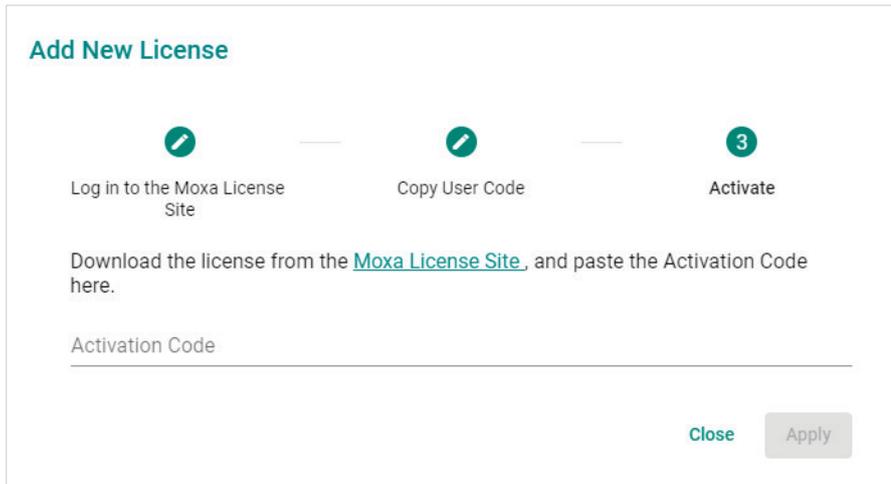

Close **Next**

3. Copy the User Code.

The screenshot shows a dialog box titled "Add New License" with a progress indicator showing three steps: 1. Log in to the Moxa License Site, 2. Copy User Code, and 3. Activate. Step 2 is currently active. Below the progress indicator, there is a text prompt: "Copy the User Code to the [Moxa License Site](#)". Underneath, there is a label "User Code:" followed by a greyed-out input field and a copy icon. At the bottom right, there are "Close" and "Next" buttons.

4. Input a valid activation code.

The screenshot shows the same "Add New License" dialog box, but now step 3, "Activate", is active. The progress indicator shows steps 1 and 2 as completed. The text prompt now reads: "Download the license from the [Moxa License Site](#), and paste the Activation Code here." Below this, there is a label "Activation Code" followed by a text input field. At the bottom right, there are "Close" and "Apply" buttons.

5. Click **Apply**.
MXview One activates the new license.

NOTE

Please reference Chapter 4: **License Management** to get more details on how to get the activation code.

Using Device Discovery

MXview One provides Device Discovery to help users quickly determine the network topology and handle basic configuration tasks.

1. To launch Device Discovery manually please do the following:

Navigate to **Menu** (☰) > **Device Discovery**.

Device Discovery appears to the right of the navigation panel.

Enabled/Disabled	Name	First IP Address	Last IP Address	Group	Site Name
0 of 0					

2. Add the IP address ranges to scan for devices.

NOTE

MXview One supports scanning multiple IP address ranges. The selected IP address scan ranges must be enabled in order for MXview One to scan for devices.

NOTE

Moxa devices must have the SNMP function enabled for MXview One to scan the devices.

Add Scan Range

Enable Scan Range *
Enabled

Name *

First IP Address * CIDR Prefix *
/24 (255.255.255.0)

Last IP Address * CIDR Address Range

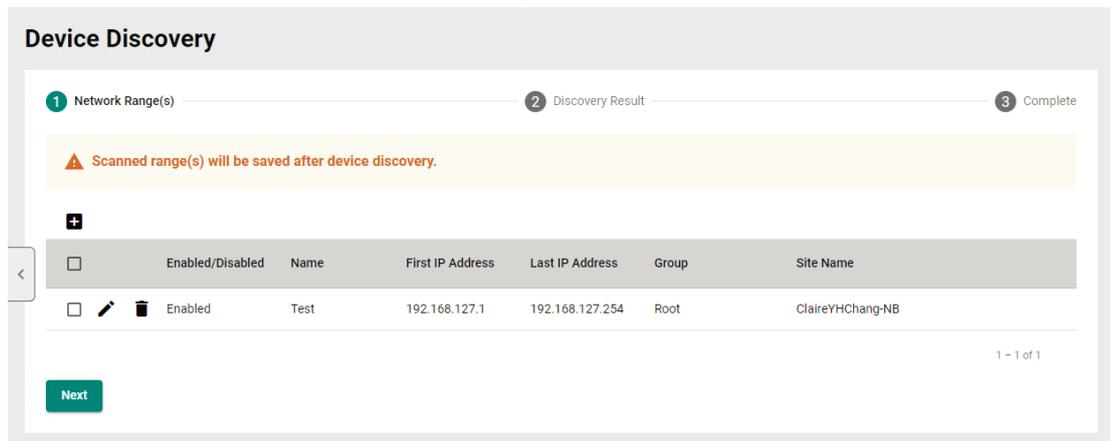

Group *
Root

Cancel Add

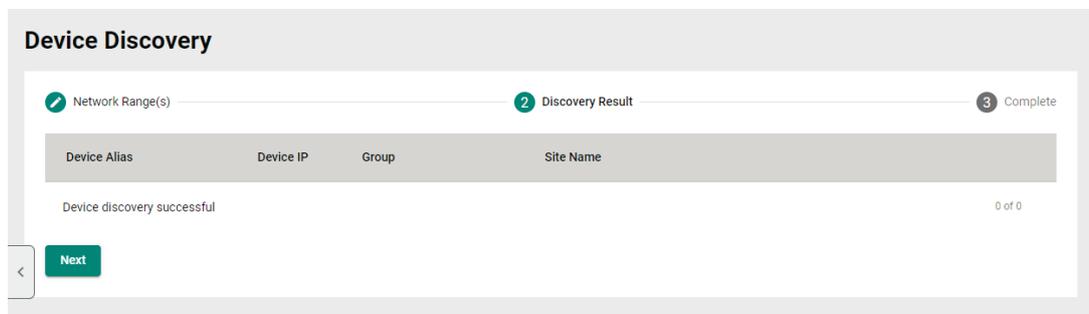

- a. Click the **Add** (+) icon.
The **Add Scan Range** screen appears.
- b. Select one of the following options:
 - Enabled:** Select to enable scanning of the specified IP address range.
 - Disabled:** Select to disable scanning of the specified IP address range.

- c. Configure the following:
 - Provide a custom display Name for the scan range.
 - Specify the **First IP Address** of the scan range.
 - Specify the **Last IP Address** of the scan range.
 - Select the **CIDR Prefix** for the scan range (if applicable).
 - Select the MXview One **Group** to assign the scan range to.
- d. Click **Add**.
- e. (Optional) Add additional network scan ranges, repeat the previous steps.
- f. (Optional) Modify scan range settings, click the **Edit** (✎) icon next to an added scan range.
- g. (Optional) Remove a scan range, click the **Delete** (🗑️) icon next to the added scan range.
- h. Select one or more scan ranges to scan.
- i. Click **Next**.

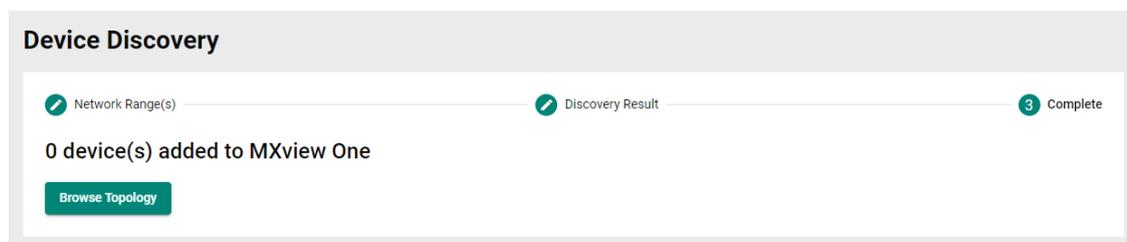

MXview One scans the specified IP address ranges for devices.

3. View devices discovered on the network.
 - a. MXview One displays discovered devices on the **Discovery Result** list. Scroll down to view more devices on the list.

- b. Click **Next**.
4. Click **Browse Topology** to view the detailed network topology. The **Topology** screen appears.

NOTE

MXview One cannot guarantee that it can draw the link of the topology for non LLDP devices. However, you can draw the link of the topology manually by clicking **Add Link**.

Account Management

To launch Account Management, please do the following: Navigate to **Menu** (☰) > **Account Management**.

The Account Management screen allows you to view, add, modify, and delete user accounts from MXview One. You can also export a list of user accounts and related information as a CSV file.

The screenshot shows the 'Account Management' interface. It has three tabs: 'User Account', 'Password Policy', and 'Login Notification'. The 'User Account' tab is active. On the left, there is a sidebar with a tree view showing 'All Users (3)', 'Administrator (1)', 'Supervisor (0)', and 'User (2)'. The main area displays a table of users with columns for 'Username', 'Authority', and 'Accessible Sites'. There are also icons for adding, editing, and deleting users, and a search bar. The table lists three users: 'admin' (Administrator), 'user' (User), and 'guest' (User). A pagination indicator at the bottom right shows '1 - 3 of 3'.

MXview One provides three default accounts:

- admin
- user
- guest

Default Username	Default Password	Authority
admin	moxa	Administrator
user	moxa	User
guest	moxa	User

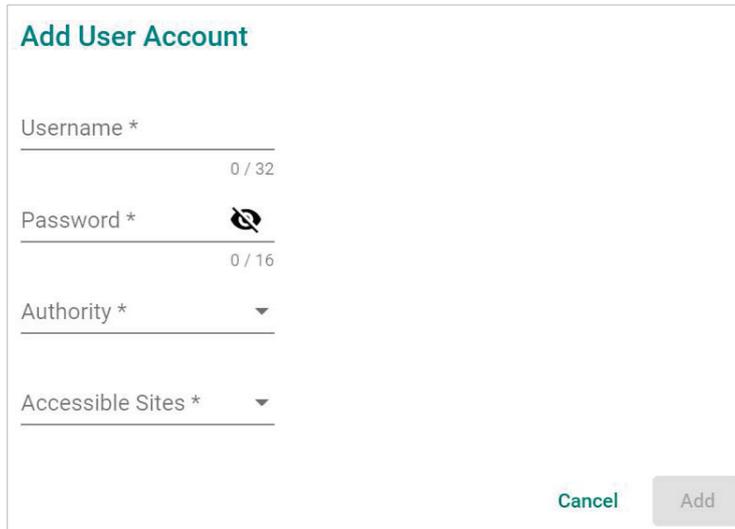

Each account can be assigned one of the following **Authority** permissions:

- **Administrator:** Has full access rights to modify any settings/configurations and can assign authorities to other accounts.
- **Supervisor:** Has full access rights to modify any settings/configurations on all pages apart from the **Account Management** page.
- **User:** Has the permissions listed below.

Function	Description
Dashboard	Read-only
Topology	Read-only
Event History	Can do some actions: Export, Filter
Syslog Viewer	Can do some actions: Export, Filter
Inventory Report	Can do some actions: Export
About MXview One	Can check the version
User Manual	Can link to the document
API Documentation	Can link to the document

Adding User Accounts

1. Navigate to **Menu** (☰) > **Administration** > **Account Management**.
The **Account Management** screen appears.
2. Click the **Add** (+) icon in the top right corner of the screen.
The **Add user account** screen appears.

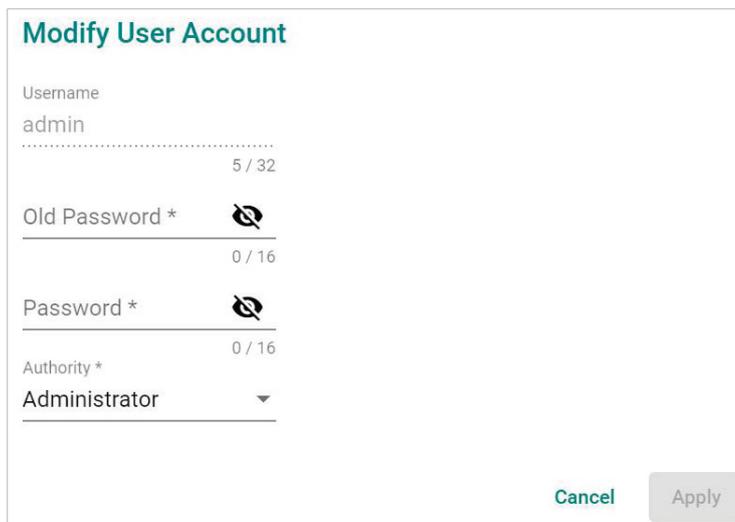

The screenshot shows the 'Add User Account' form with the following fields and controls:

- Username ***: Text input field with a character count of 0 / 32.
- Password ***: Password input field with a character count of 0 / 16 and a visibility toggle icon.
- Authority ***: Dropdown menu.
- Accessible Sites ***: Dropdown menu.
- Buttons**: 'Cancel' and 'Add' buttons at the bottom right.

3. Configure the following account details:
 - > **Username:** Specify the Username for the account
 - > **Password:** Specify the login password (minimum length: 4 characters) for the account
 - > **Authority:** Assign the authority permission (Administrator, Supervisor, or User) for the account
 - > **Accessible Sites:** Select which site(s) the account can access
4. Click **Add**.

Modifying User Accounts

1. Navigate to **Menu** (☰) > **Administration** > **Account Management**.
The **Account Management** screen appears.
2. Click the **Edit** (✎) icon in front of the account you want to modify.
The **Modify user account** screen appears.

The screenshot shows the 'Modify User Account' form with the following fields and controls:

- Username**: Text input field containing 'admin' with a character count of 5 / 32.
- Old Password ***: Password input field with a character count of 0 / 16 and a visibility toggle icon.
- Password ***: Password input field with a character count of 0 / 16 and a visibility toggle icon.
- Authority ***: Dropdown menu with 'Administrator' selected.
- Buttons**: 'Cancel' and 'Apply' buttons at the bottom right.

3. Modify the following account details:
 - **Password:** Specify the login password (minimum length: 4 characters) for the account
 - **Authority:** Assign the authority permission (Administrator, Supervisor, or User) for the account
4. Click **Apply**.

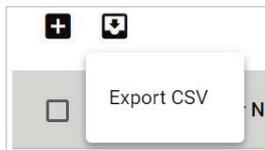

Deleting User Accounts

1. Navigate to **Menu** (☰) > **Administration** > **Account Management**.
The **Account Management** screen appears.
2. (Optional) Select the check box(es) in front of one or more account(s).
3. Click the **Delete** (🗑️) icon in front of the account you want to delete, or in the top left corner of the screen (if multiple accounts are selected).
MXview One deletes the account(s).

Exporting User Accounts

The Account Management screen allows you to export a CSV file containing all user accounts with corresponding authority permissions and accessible sites.

1. Navigate to **Menu** (☰) > **Administration** > **Account Management**.
The **Account Management** screen appears.
2. Click the **Export** (📄) icon.

3. Select **Export CSV**.

Configuring the Password Policy

Use the **Password Policy** screen to modify the password requirements for user accounts.

1. Navigate to **Menu** (☰) > **Administration** > **Account Management** > **Password Policy**.
The **Password Policy** screen appears.

Account Management

User Account
Password Policy
Login Notification

Minimum length (4 - 16) *

4

Password complexity strength check

At least one digit (0-9)

Mixed upper and lower case letters (A-Z, a-z)

At least one special character (~!@#\$\$%^&*-_!;,:.<>[]{}())

Save

2. Specify the minimum password length (between 4 to 16 characters).
3. Select one or more of the following password complexity requirements:
 - **At least one digit (0~9)**
 - **Mixed upper and lower case letters (A~Z, a~z)**
 - **At least one special character (~!@#\$%^&*-_!;:,.<>[]{}())**
4. Click **Save**.
MXview One requires all new account passwords to satisfy the modified password policy.

Configuring Login Notifications

Use the **Password Policy** screen to customize the notifications displayed when users log in to MXview One.

1. Navigate to **Menu (☰) > Administration > Account Management > Login Notification**.
The **Login Notification** screen appears.

The screenshot shows the 'Account Management' interface with the 'Login Notification' tab selected. It includes checkboxes for 'Show Login Failure Records' and 'Show Default Password Notification', both of which are checked. There are two text input fields for 'Login Message' and 'Login Authentication Failure Message', each with a character count of 0 / 250. A green 'Save' button is located at the bottom left of the configuration area.

2. To enable the following notification(s), select the corresponding checkbox(es):
 - **Show Login Failure Records**
 - **Show Default Password Notification**
3. To disable the following notification(s), clear the corresponding checkbox(es):
 - **Show Login Failure Records**
 - **Show Default Password Notification**
4. To display a custom login message, type a string (up to 250 characters in length) in the **Login Message** field.
5. To display a custom login authentication failure message, type a string (up to 250 characters in length) in the **Login Authentication Failure Message** field.
6. Click **Save**.
MXview One displays the configured login notifications the next time a user logs in.

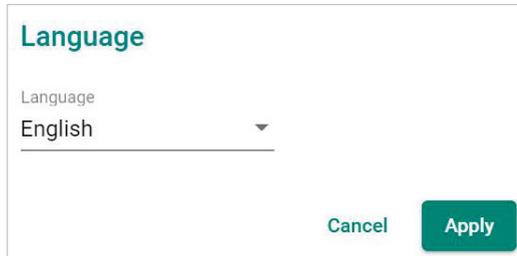

Changing the Display Language

Use the **Language** icon screen to customize the notifications displayed when users log in to MXview One.

1. Navigate to **Language** (🌐).

The **Language** screen appears.

2. Select language.

3. MXview One supports the following languages:

- **German (Deutsch)**
- **Japanese (日本語)**
- **English**
- **Spanish (Español)**
- **French (Français)**
- **Simplified Chinese (简体中文)**
- **Traditional Chinese (繁體中文)**

4. Click **Save**.

MXview One updates the display language.

4. License Management

License Management Overview

The **License Management** screen displays information about your MXview One license, including the license types, the number of licensed nodes, nodes currently in use, and the Add-on license. You can also use the **License Management** screen to add a new license or deactivate an existing license.

To access the **License Management** screen, navigate to **Menu** (☰) > **Administration** > **License Management**.

The screenshot displays the 'License Management' interface. At the top, it shows 'MXview One' with a help icon. Below this, there are three license categories: 'Node License' (Mode: Trial, Currently Used: 3, Total Number of Licenses: 2000), 'Wireless Add-on License' (Mode: None), and 'Power Add-on License' (Mode: None). A link to 'Moxa License Site' and an 'Add New License' button are also visible. The main area contains four cards: 'Trial Remaining' showing 47 days, 'Wireless Free Trial' with a 'Start Trial' button, 'Power Free Trial' with a 'Start Trial' button, and 'Re-activate License' with a 'Re-activate' button.

License Type

MXview One provides numerous types of licenses. Each license has a specific function.

Trial License	You can experience the power of MXview One for 90 days.
Node License	Specifies the number of devices that MXview One can monitor in the network.
Wireless Add-on License	Allows users to access additional wireless related functions.
Power Add-on License	Allows users to access additional power related functions.

License Type

Trial License You can experience the power of MXview One for 90 days.

Node License Specifies the number of the devices that MXview One can monitor in the network.

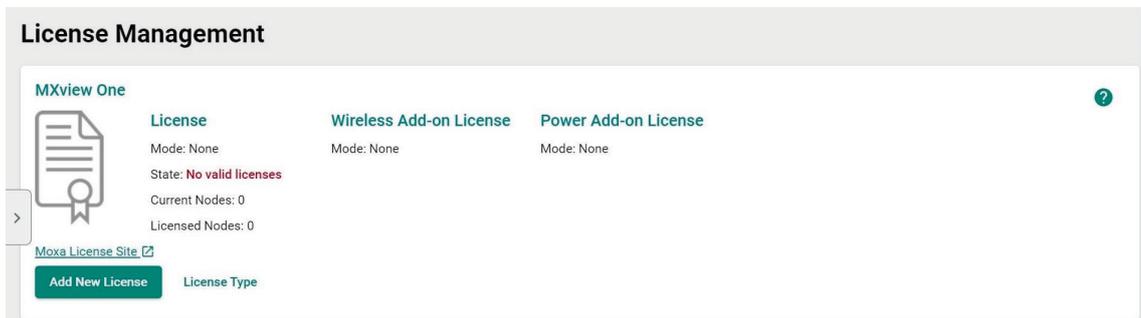

Wireless Add-on License Allows users to access additional wireless related functions.

Power Add-on License Allows users to access additional power related functions.

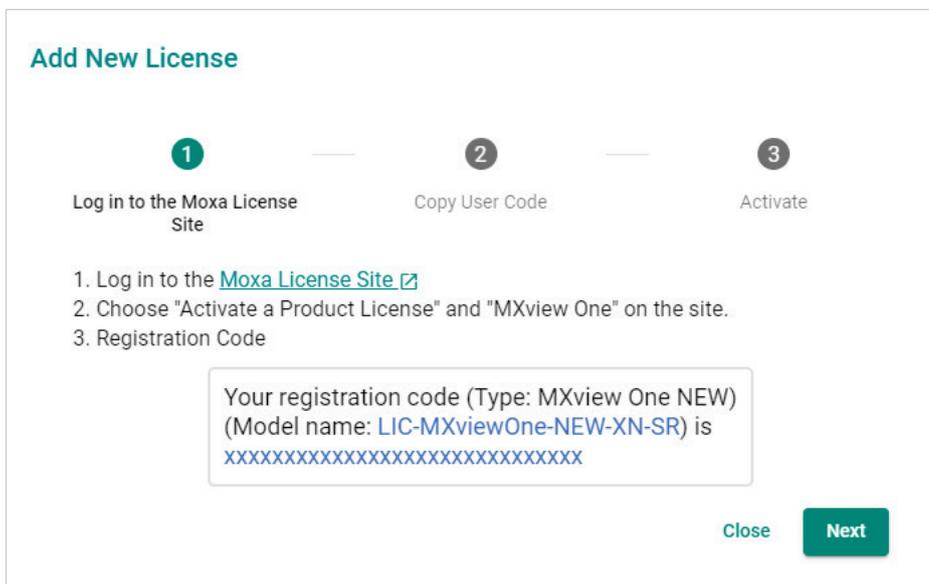

[Close](#)

Adding a New License

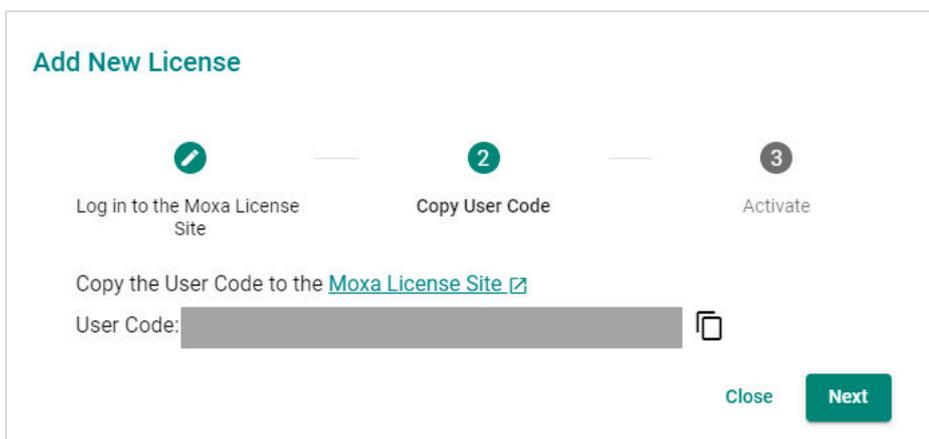

1. Navigate to **Menu** (☰) > **Administration** > **License Management**.
The **License Management** screen appears.
2. In the **Add New License** section, click **Add New License**.

The **Add New License** screen appears.

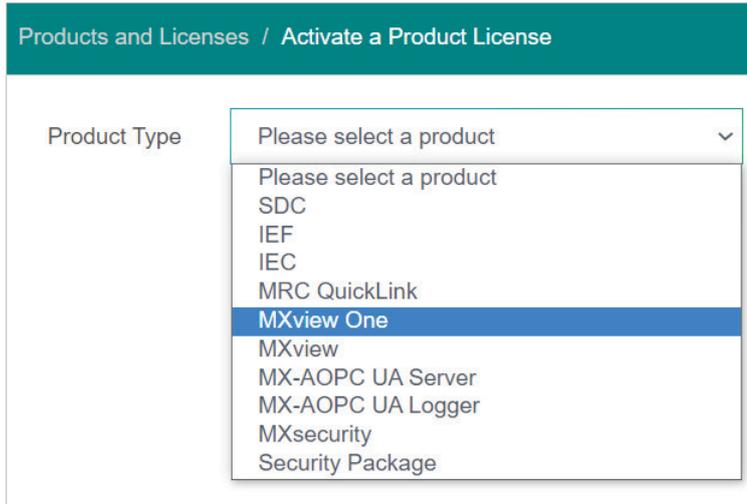

3. Click **Next**.
4. Copy the User Code and click **Next**.

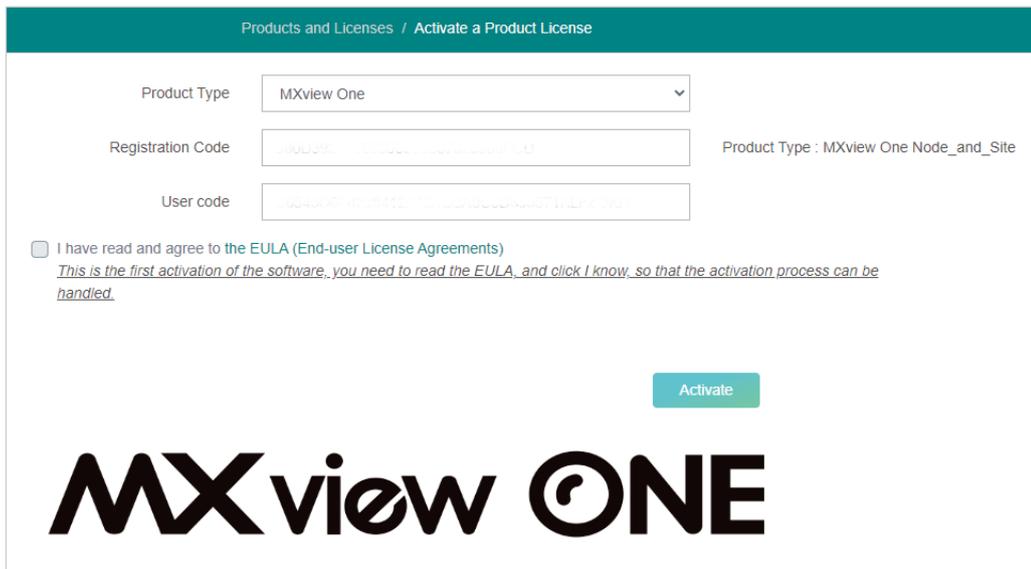

5. Open a web browser and go to <https://license.moxa.com/>. Select **MXview One** and Log in to your Moxa account.

- Click **Products and Licenses > Activate a Product License**. Then, select **MXview One** from the product type list.

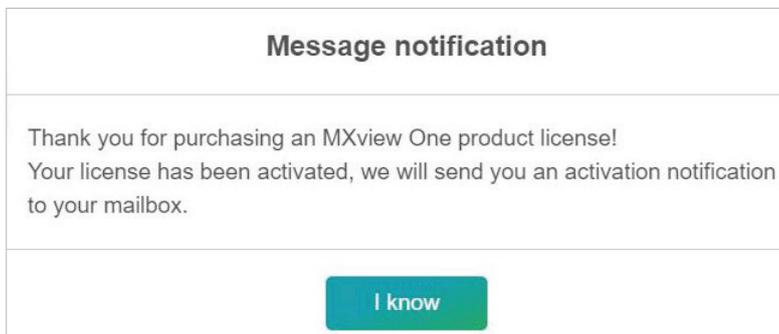

The screenshot shows the 'Products and Licenses / Activate a Product License' page. A dropdown menu for 'Product Type' is open, displaying a list of product options. 'MXview One' is highlighted in blue, indicating it is the selected option. Other options include SDC, IEF, IEC, MRC QuickLink, MXview, MX-AOPC UA Server, MX-AOPC UA Logger, MXsecurity, and Security Package.

- Input a valid **Registration Code** and see if the Product Type behind the Registration Code has displayed correctly of your license.
- Paste a valid **User code** from MXview One. Click "I have read and agree to the EULA (End-user License Agreements)" checkbox. Then click **Activate** to get the activation code.

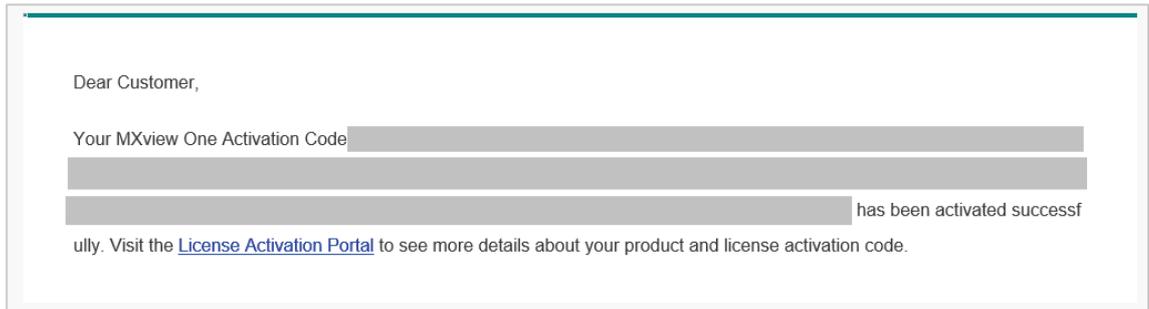

The screenshot shows the 'Products and Licenses / Activate a Product License' page with the 'Product Type' dropdown set to 'MXview One'. The 'Registration Code' field contains a blurred alphanumeric string, and the 'User code' field also contains a blurred alphanumeric string. A checkbox labeled 'I have read and agree to the EULA (End-user License Agreements)' is checked. Below the checkbox is a link: 'This is the first activation of the software, you need to read the EULA, and click I know, so that the activation process can be handled.' A green 'Activate' button is visible. At the bottom of the page, the 'MXview ONE' logo is displayed.

- Once the process has been successfully completed, a pop-up window will appear to inform you that your license code has been activated. Click **I know** to close the window. If the license failed to activate, enter the correct Registration Code and User code again. If you are still experiencing problems, please contact Moxa Support.

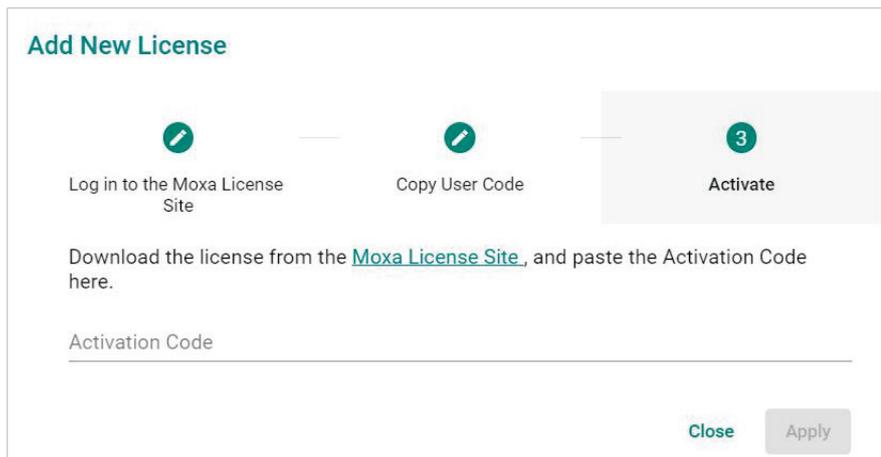

The screenshot shows a 'Message notification' pop-up window. The text inside reads: 'Thank you for purchasing an MXview One product license! Your license has been activated, we will send you an activation notification to your mailbox.' At the bottom of the window, there is a green button labeled 'I know'.

10. Check your email account you used to apply for your moxa account. The activation code will be sent to this email address.

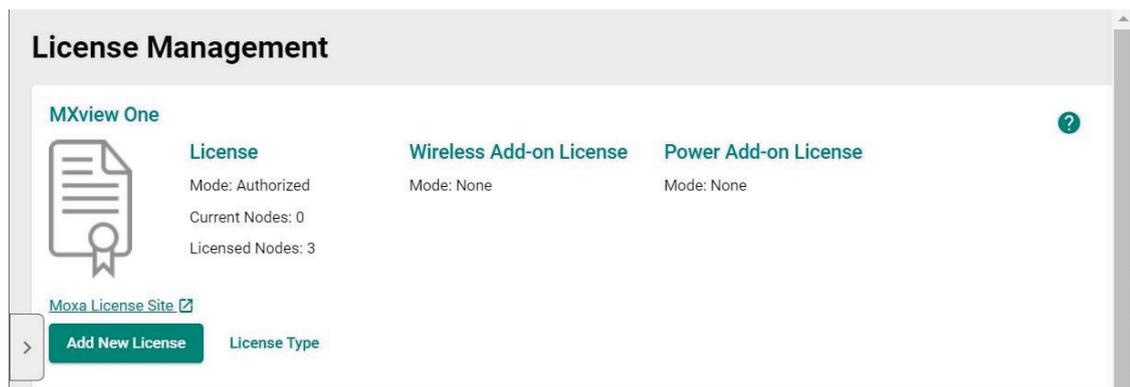

11. Copy the activation code from the email.
12. In MXview One, paste the activation code into the **Activation Code** field.

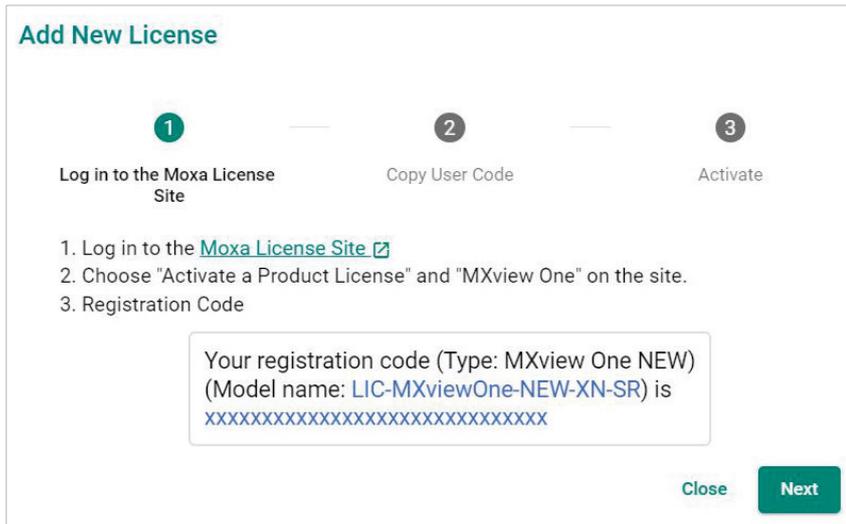

13. Click **Apply** and then MXview One will activate the new license.

Adding an Add-on License

1. Navigate to **Menu** (☰) > **Administration** > **License Management**. The **License Management** screen will appear.

2. Click **Add New License**. The **Add New License** screen will appear.

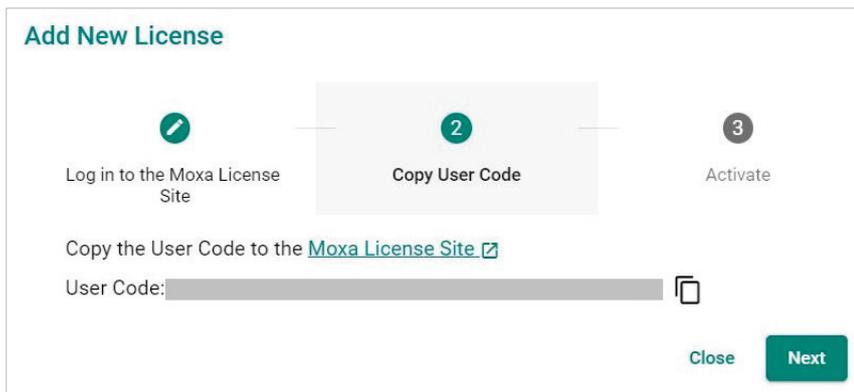

3. Click **Next**.
4. Copy the User Code and click **Next**.

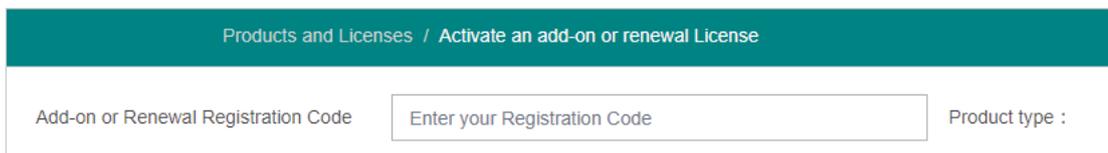

NOTE

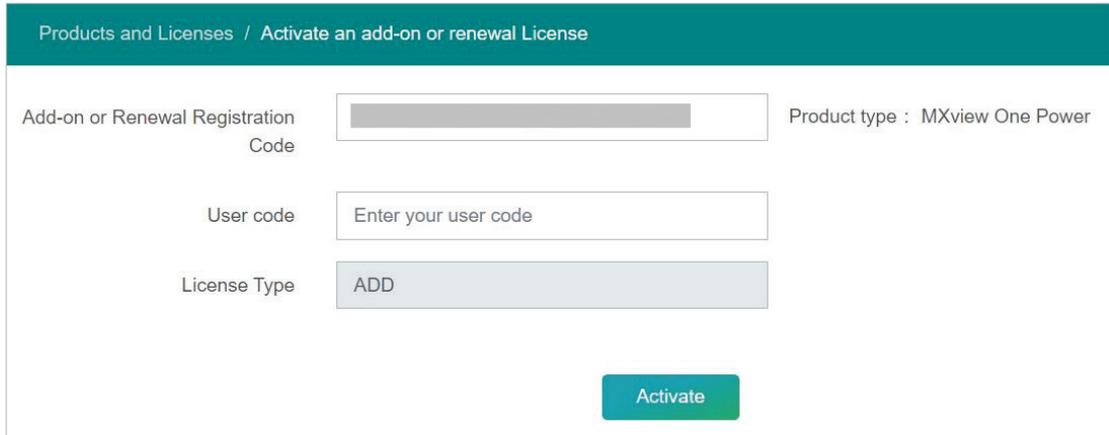

Please activate the Node-based License before activating the Add-on License.

5. Open a web browser and go to <https://license.moxa.com/>. Select **MXview One** and log in to your Moxa account.
6. Click **Products and Licenses > Activate an add-on or renewal License**. Input a valid **Add-on Registration Code** and see if the Product Type behind the Registration Code has shown your license correctly.

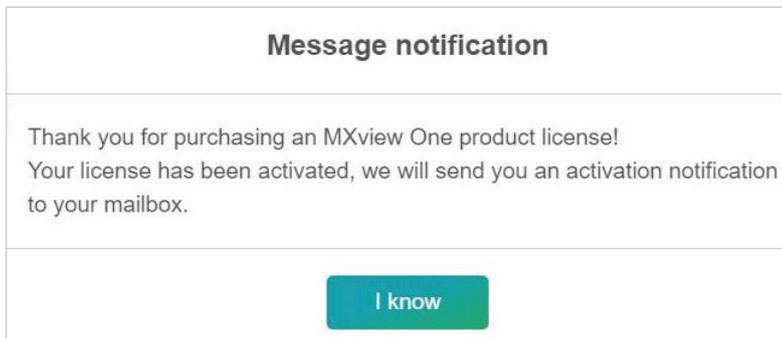

7. Paste a valid User code from MXview One. Then, click **Activate** to get the activation code.

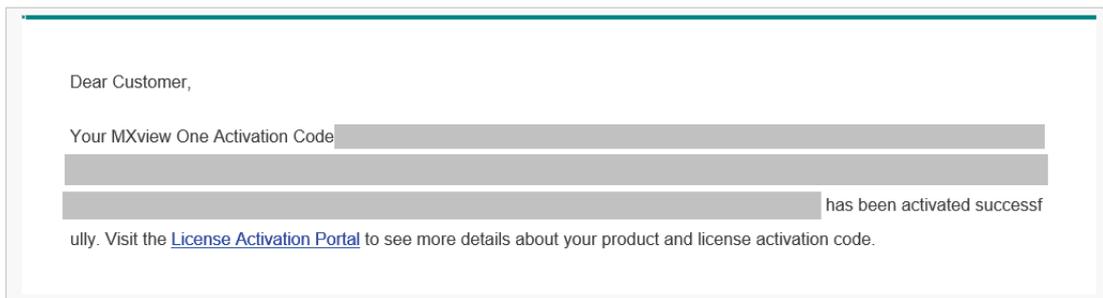

The screenshot shows a web interface for activating a license. At the top, there is a teal header with the text "Products and Licenses / Activate an add-on or renewal License". Below the header, there are three input fields: "Add-on or Renewal Registration Code" (with a greyed-out placeholder), "User code" (with the placeholder "Enter your user code"), and "License Type" (with the value "ADD"). To the right of the first field, it says "Product type : MXview One Power". At the bottom right, there is a teal "Activate" button.

8. Once the process has been successfully completed, a pop-up window will appear to inform you that your license code has been activated. Click **I know** to close the window. If the license failed to activate, enter the correct Registration Code and User code again. If you are still experiencing problems, please contact Moxa Support.

The screenshot shows a "Message notification" pop-up window. The title is "Message notification". The main text reads: "Thank you for purchasing an MXview One product license! Your license has been activated, we will send you an activation notification to your mailbox." At the bottom center, there is a teal "I know" button.

9. Check the email account you used to apply for your moxa account. The activation code will be sent to this email address.

The screenshot shows an email notification. It starts with "Dear Customer,". Below that, it says "Your MXview One Activation Code" followed by a greyed-out placeholder. The next line is another greyed-out placeholder. The final line says "has been activated successfully. Visit the [License Activation Portal](#) to see more details about your product and license activation code."

10. Copy the activation code from the email.

11. In MXview One, paste the activation code into the Activation Code field.

Add New License

1 Log in to the Moxa License Site

2 Copy User Code

3 **Activate**

Download the license from the [Moxa License Site](#), and paste the Activation Code here.

Activation Code

Close Apply

12. Click **Apply** and MXview One will activate the license.

Deactivating a License

If you want to transfer a license to a different instance of MXview One, the license has to be deactivated first.

1. Navigate to **Menu** (☰) > **Administration** > **License Management**.
The **License Management** screen appears.
2. Expand the **Licenses** section.
A list of activated licenses and activation codes appears.
3. Click **Deactivate** and MXview One will deactivate the license.

License Management

Deactivate

NOTE

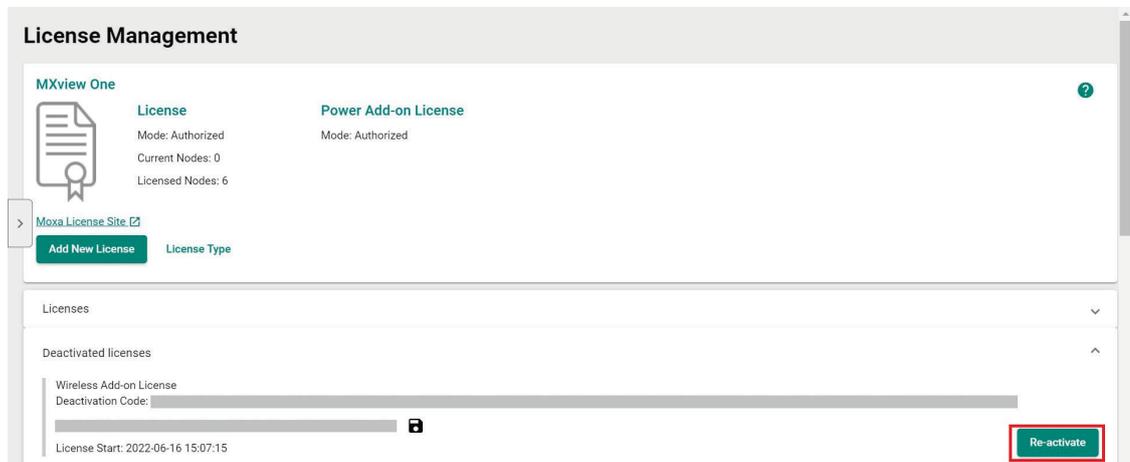

If you only have one Node-based License with one Add-on License, you will have to deactivate the Add-on License first, then deactivate the Node-based License next.

If you have more than one Node-based License, it is ok for you to deactivate the Node-based License or Add-on License without any order.

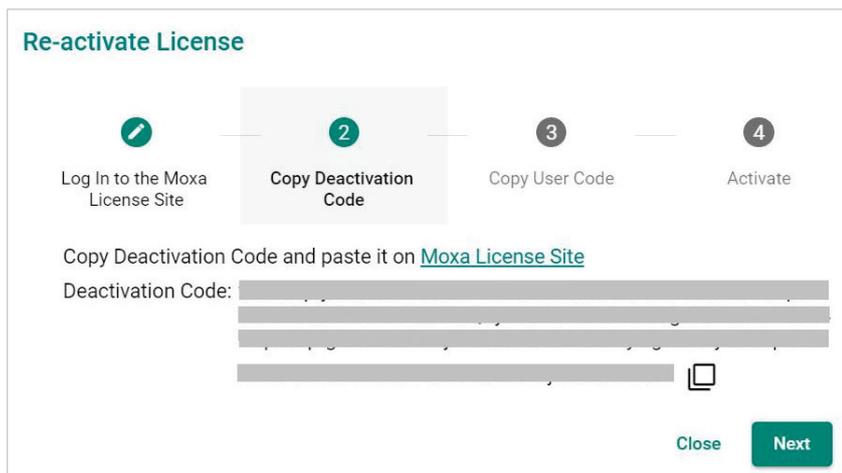

Reactivating a Deactivated License

A deactivated license can be reactivated on the current instance of MXview One.

1. Navigate to **Menu** (☰) > **Administration** > **License Management**.
The **License Management** screen appears.
2. Expand the **Deactivated Licenses** section.
A list of deactivated licenses and deactivation codes will appear.

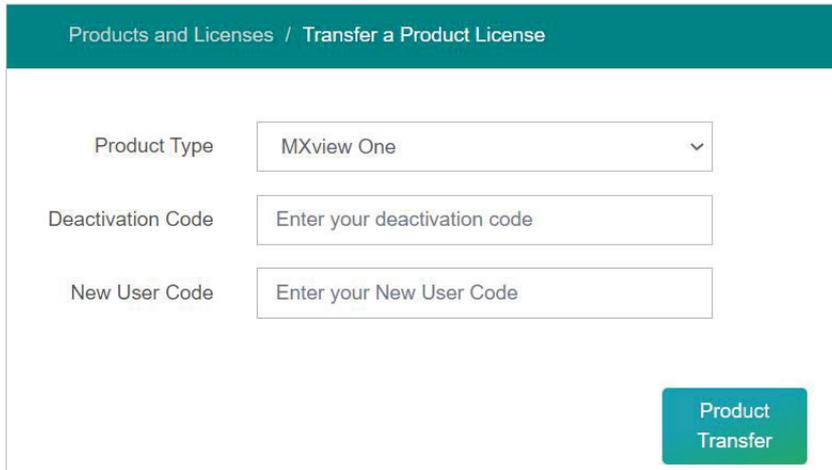

3. Click **Re-activate** and then click **Next**.
4. Copy the deactivation code and click **Next**.

5. Open a web browser and go to <https://license.moxa.com>. Select **MXview One** and log in using your Moxa account.
6. Select **Products and Licenses** and click **Transfer a Product License**. Then, select **MXview One** from the product type list.

7. Paste the **Deactivation Code** followed by the **New User Code** from MXview One. Then, click **Product Transfer**.

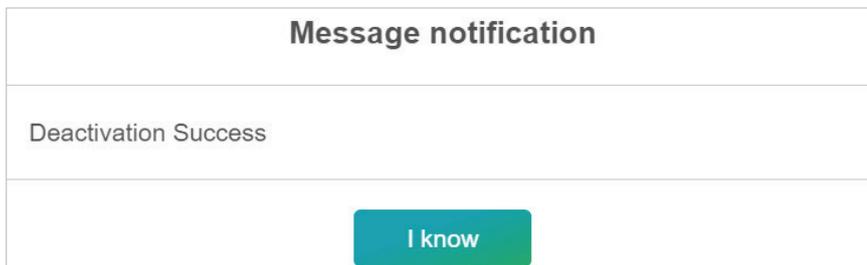

NOTE

'Reactivating a Deactivated License' and 'Transfer a Deactivated License to another MXview One instance' are using the same menu here.

If you are implementing 'Reactivating a Deactivated License' on the current instance of MXview One, please paste the current MXview One User code in the 'New User Code' section.

8. Once the process has been successfully completed, a pop-up window will appear to inform you that your license code has been deactivated. Click **I know** to close the window. If the license failed to deactivate, enter the license key again. If you are still experiencing problems, please contact Moxa Support.

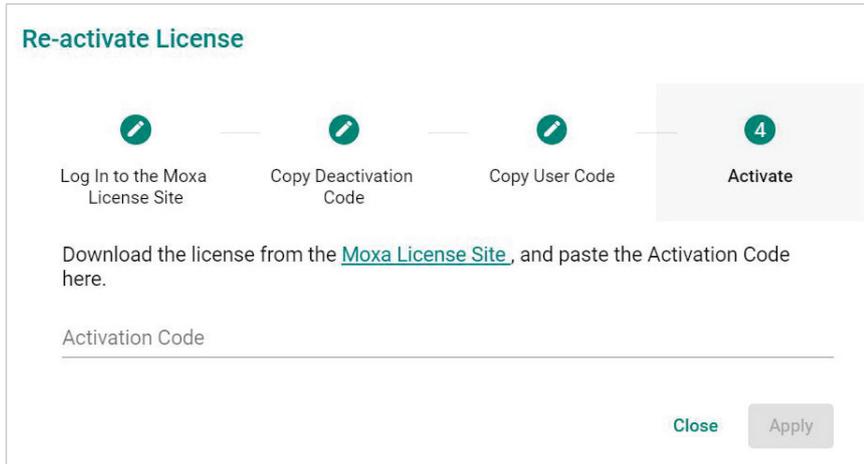

9. Check the email account you used to apply for your moxa account. The activation code will be sent to this email address.

License Activation Portal to see more details about your product and license activation code.'" data-bbox="194 655 892 811"/>

10. Copy the activation code from the email.

11. In MXview One, paste the activation code into the Activation Code field.

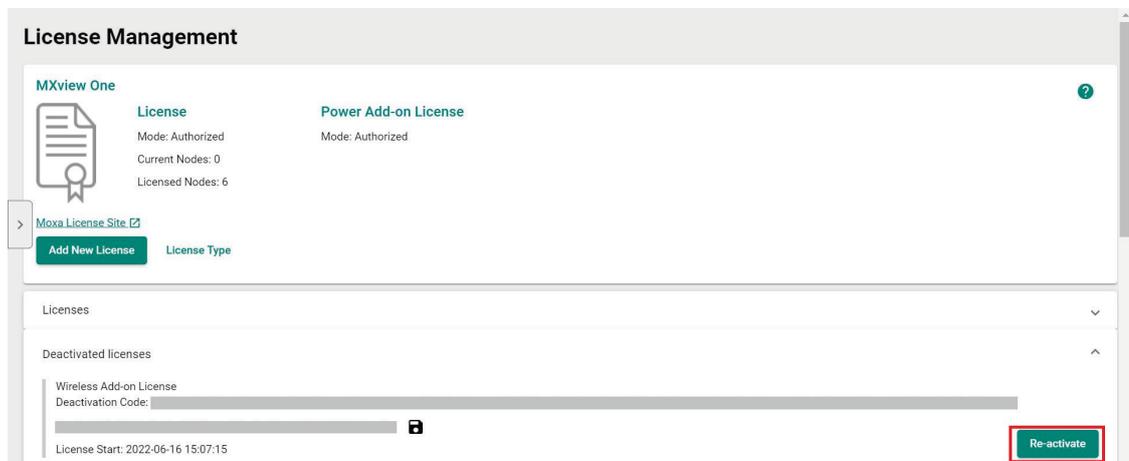

The dialog box titled "Re-activate License" shows a four-step process: 1. Log In to the Moxa License Site, 2. Copy Deactivation Code, 3. Copy User Code, and 4. Activate. Below the steps, it instructs the user to download a license from the Moxa License Site and paste the activation code into a text field. The "Activate" button is highlighted in gray, and there are "Close" and "Apply" buttons at the bottom right.

12. Click **Apply** and MXview One will reactivate the license.

Transferring a License to a Different Instance of MXview One

A deactivated license can be transferred to a new instance of MXview One.

1. Navigate to **Menu** (☰) > **Administration** > **License Management**. The **License Management** page will appear.
2. Expand the **Deactivated Licenses** section. A list of deactivated licenses and deactivation codes will appear. Copy the deactivation codes.

The "License Management" interface shows two license types: "MXview One" and "Power Add-on License". Below these, there is a "Deactivated licenses" section with a table containing a "Wireless Add-on License" with its deactivation code and a "Re-activate" button highlighted in red.

3. Open a web browser and go to <https://license.moxa.com>. Select **MXview One** and log in using your Moxa account.
4. Select **Products and Licenses** and click **Transfer a Product License**. Then, select **MXview One** from the product type list.

5. Paste the **Deactivation Code** and the **New User Code** from a new installation of MXview One. Then, click **Product Transfer**.

The screenshot shows a web interface for transferring a product license. At the top, there is a teal header with the text "Products and Licenses / Transfer a Product License". Below the header, there are three input fields: "Product Type" with a dropdown menu showing "MXview One", "Deactivation Code" with a text input field containing the placeholder "Enter your deactivation code", and "New User Code" with a text input field containing the placeholder "Enter your New User Code". A teal "Product Transfer" button is located at the bottom right of the form.

NOTE

To obtain a new User Code, please visit "**Adding a New License**", and follow steps 1 to 4 to obtain and copy the new User Code.

6. Once the process has been successfully completed, a pop-up window will appear to inform you that your license code has been deactivated. Click **I know** to close the window. If the license failed to deactivate, enter the license key again. If you are still experiencing problems, please contact Moxa Support.

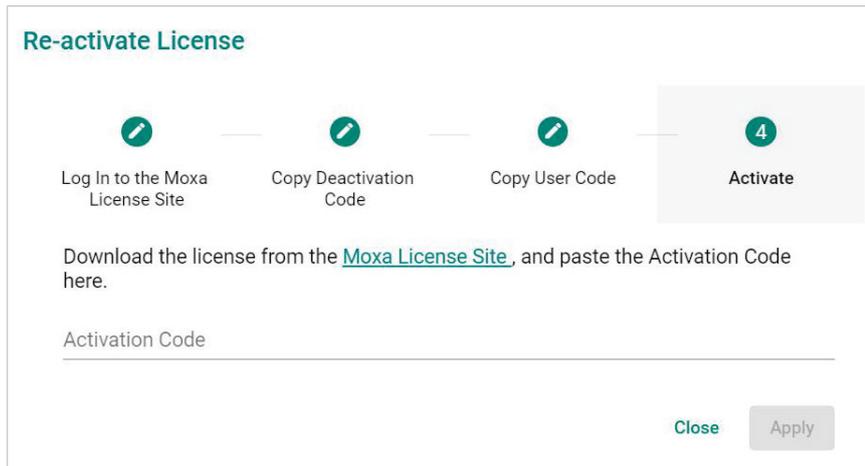

The screenshot shows a "Message notification" pop-up window. The title is "Message notification". Below the title, the text "Deactivation Success" is displayed. At the bottom of the window, there is a teal button labeled "I know".

7. Check the email account you used to apply for your moxa account. The activation code will be sent to this email address.

The screenshot shows an email notification from Moxa. At the top, the Moxa logo is displayed. Below the logo, the text "Dear Customer," is followed by "Your New MXview One Activation Code" and a redacted activation code. The email concludes with the text: "ed successfully. You can now start using MXview on this system. Visit the [License Activation Portal](#) to see more details about your product and license activation code."

8. Copy the activation code from the email.

- In MXview One, paste the activation code into the Activation Code field.

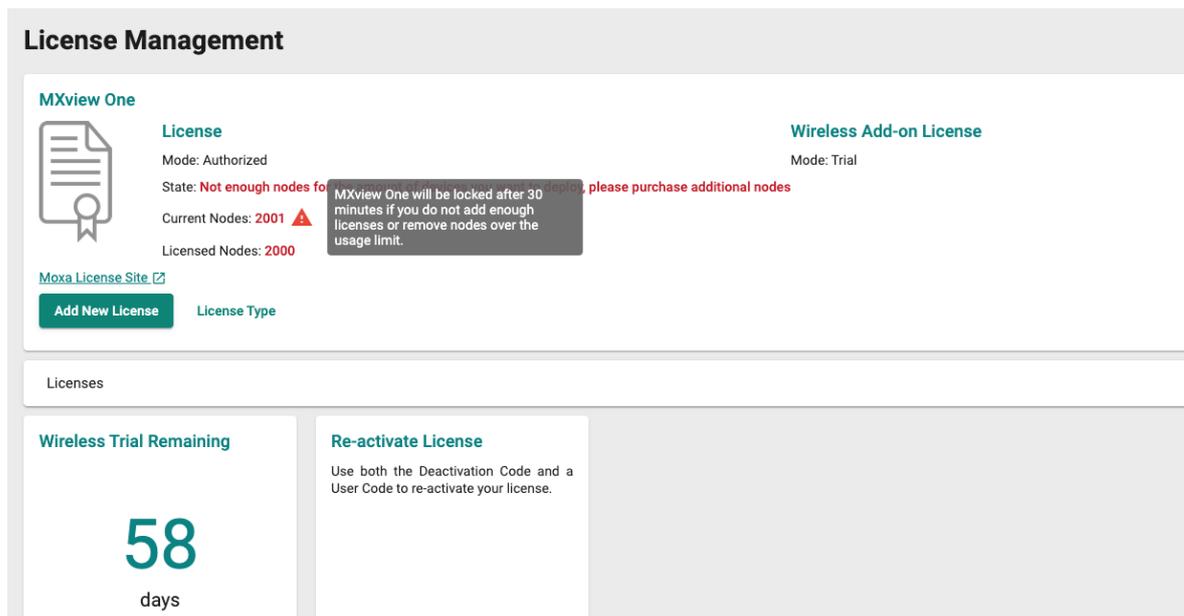

The dialog box titled "Re-activate License" shows a four-step process: 1. Log In to the Moxa License Site, 2. Copy Deactivation Code, 3. Copy User Code, and 4. Activate. Below the steps, it instructs the user to download the license from the Moxa License Site and paste the Activation Code. There is a text input field for the Activation Code and "Close" and "Apply" buttons at the bottom right.

- Click **Apply** and MXview One will reactivate the license.

Quantity of Monitored Devices Exceeds the Number of Node-based Licenses

When the quantity of monitored devices exceeds the activated number of license nodes, you can purchase additional Node-based Licenses and activate them as required. Or you can delete the extra devices that you don't have to monitor.

The screenshot shows the "License Management" section. It features two license cards: "MXview One" (Authorized, 2001 current nodes, 2000 licensed nodes) and "Wireless Add-on License" (Trial). A warning message states: "MXview One will be locked after 30 minutes if you do not add enough licenses or remove nodes over the usage limit." Below the cards, there is a "Wireless Trial Remaining" widget showing 58 days and a "Re-activate License" widget with instructions to use deactivation and user codes.

1. Buy Extra Node-based Licenses

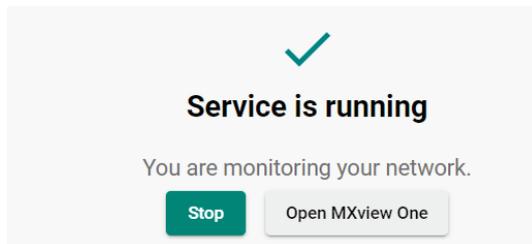

Order the required quantity of Node-based Licenses from your channel or Moxa Sales Representative. Then, follow the instructions on **Adding a New License** to activate a new license.

2. Delete Extra Devices

- You can delete the devices on the **Topology** page to meet the number of Node-based Licenses you available.

b. Please follow the instructions below:

- ❑ Press the **Stop** button in the Control Panel.

- ❑ After 1 minute, Click **Start** and wait for the status to display 'Service is running now'. Then, click **Open MXview One** and Log in to MXview One.
- ❑ Navigate to **Menu** (☰) > **Topology**.
The **Topology** screen will appear and displays the Topology Map by default.
- ❑ Click the devices you want to delete and then click **Delete**. From now on, MXview One will not count the delete devices.

5. Dashboard Widgets

The MXview One **Dashboard** contains several widgets that provide summary information about your network devices and event highlights.

Dashboard Overview

To access the Dashboard, navigate to **Menu** (☰) > **Dashboard**.

Use the **Dashboard** to gain a quick overview of your network devices, important system events.

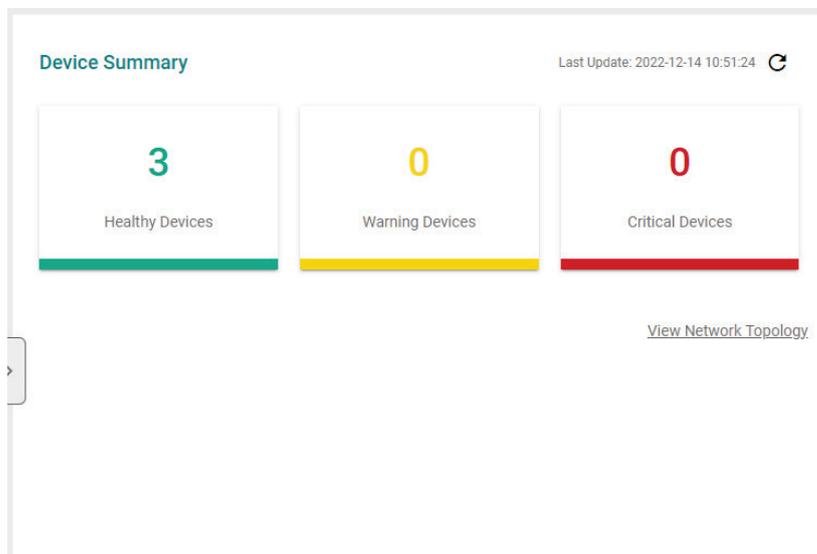

The **Dashboard** displays the following widgets:

- Device Summary
- Event Highlights: Cold/Warm Start Trap
- Event Highlights: ICMP Unreachable
- Event Highlights: Link Down

To refresh the data displayed in all the widgets, click the **Settings** (⚙️) icon in the top right corner of the screen and select **Refresh All**.

Device Summary

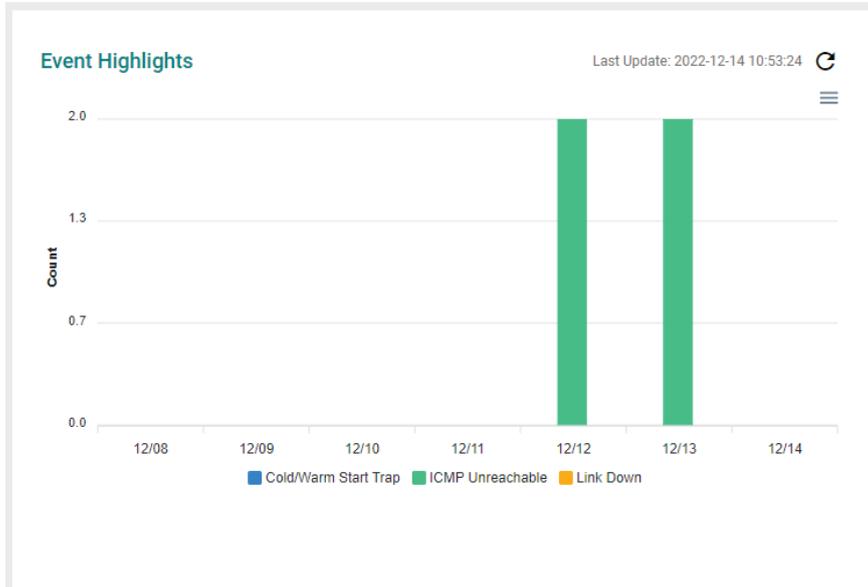

The **Device Summary** widget displays the following information about the devices on your network:

- **Healthy Devices:** The number of devices with no critical events or warnings. Click to view additional details about the devices on the **Topology** screen.
- **Warning Devices:** The number of devices with warnings. Click to view additional details about the devices on the **Topology** screen.
- **Critical Devices:** The number of devices with critical events. Click to view additional details about the devices on the **Topology** screen.

Event Highlights

The Event Highlights will display the following events during the past seven days: Cold/Warm Start Trap, ICMP Unreachable, and Link Down.

Event Highlights: The **Cold/Warm Start Trap** widget displays the number of cold start traps and warm start traps issued by devices at a site, and the day on which the events occurred.

Event Highlights: The **ICMP Unreachable** widget displays the number of times an ICMP-enabled device on your network was unreachable, and the day on which the events occurred.

Event Highlights: The **Link Down** widget displays the number of times a port link was down on a device on a specific date.

You can perform the following actions on this widget:

- To view the number of event highlights issued at a site on a specific date, hover over a bar in the widget chart.
- To view additional details about the event on the **Event History** screen, click a bar on the widget chart.
- To refresh the widget data, click the **Refresh** (🔄) button following the **Last Update** timestamp.
- To download the Event Highlights data, click (☰) below the Refresh button.

6. Device Discovery and Polling

Device Discovery Overview

MXview One uses SNMP, ICMP, and MMS to discover devices within the scan ranges. When a Moxa device has been located, MXview One will generate an actual image of the device, demonstrated below, to indicate the device's location on the network.

MXview One will also list detailed properties and configuration parameters, including the following:

- MAC Address
- Model Name
- IP Address
- Netmask
- Gateway
- Trap Server Address
- Auto IP Configuration
- Type of Redundancy Protocol
- Role in Redundancy Protocol
- Status and Properties of the Port
- Power Status
- Status and Version of the SNMP Protocol

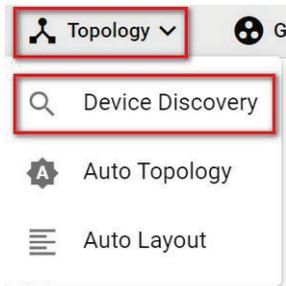

MXview One will display one of the following graphics to indicate devices:

Device	Image
Moxa devices with SNMP enabled.	
Non-Moxa devices with SNMP enabled.	
Non-Moxa devices with ICMP enabled.	
Non-Moxa devices with MMS enabled.	

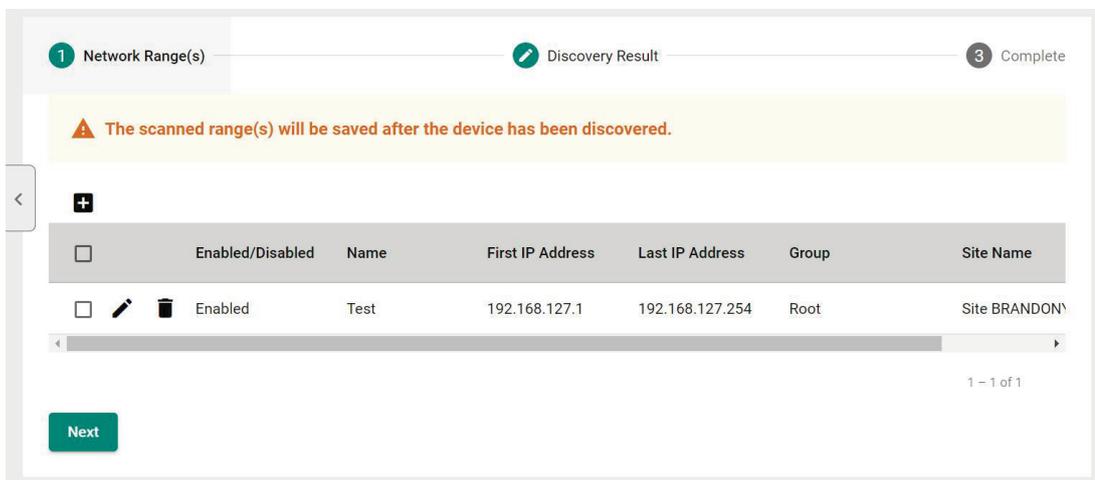

Configuring IP Address Scan Ranges

MXview One allows you to scan multiple ranges of IP addresses within your network. Each network range is defined by a starting IP address and an ending IP address. Use **Device Discovery** to configure network scan ranges.

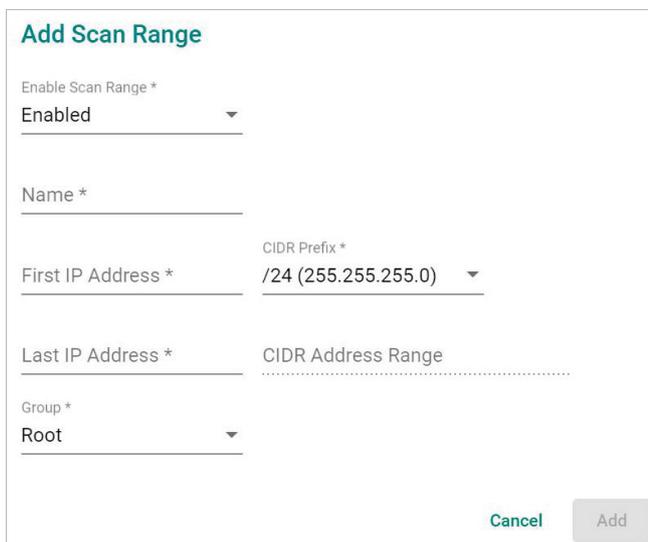

1. Access the **Device Discovery** screen by the following method:
 - a. Navigate to **Menu** (☰) > **Device Discovery**.
 - b. Navigate to **Menu** (☰) > **Topology**, and then navigate to **Topology** > **Device Discovery** from the Topology toolbar menu.

The **Device Discovery** screen will appear.

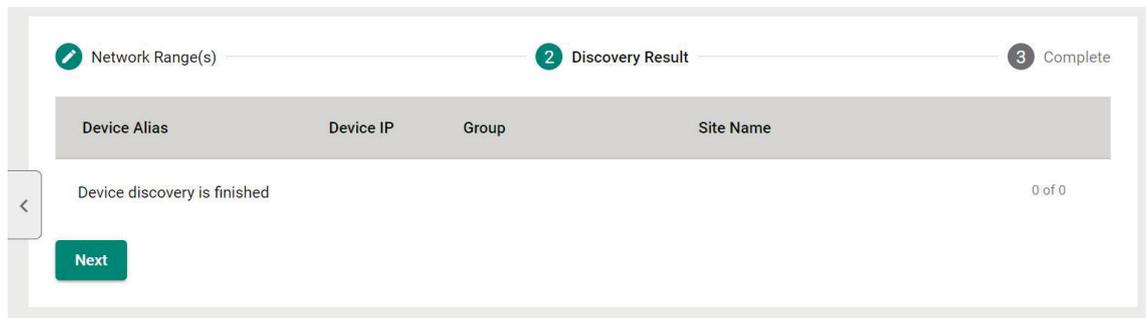

2. To add a new scan range:
 - a. Click the **Add** (+) button in the top left corner.
- The **Add Scan Range** screen will appear.

A screenshot of the 'Add Scan Range' form. It contains the following fields:

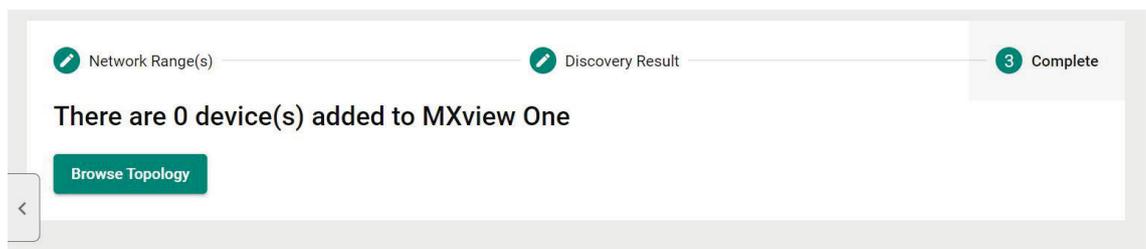

- 'Enable Scan Range *' dropdown menu set to 'Enabled'.
- 'Name *' text input field.
- 'First IP Address *' text input field and 'CIDR Prefix *' dropdown menu set to '/24 (255.255.255.0)'.
- 'Last IP Address *' text input field and 'CIDR Address Range' dropdown menu.
- 'Group *' dropdown menu set to 'Root'.

At the bottom right, there are 'Cancel' and 'Add' buttons.

- b. Select the scan range status:
 - Enabled**
 - Disabled**
 - c. Provide a **Name** for the scan range.
 - d. Provide the starting IP address for the scan range.
 - e. Provide the ending IP address for the scan range.
 - f. Select the **CIDR Prefix** (if applicable).
 - g. Assign the scan range to a **Group**.
 - h. Click **Add**.
The new scan range appears in the Network Range table.
3. To edit a scan range:
 - a. Select the check box next to the scan range in the **Network Range** table.
 - b. Click the **Edit** (✎) icon.
The **Edit Scan Range** screen appears.
 - c. Modify the scan range settings.
 - d. Click **Apply**.
The **Device Discovery** screen displays the **Network Range** table with the updated scan range information.
 4. Click **Next** to discover the devices within the specific IP address ranges.

5. To complete scan range configuration, click **Next**.
The **Complete** tab and the number of devices added to MXview One.

6. To view the updated topology, click **Browse Topology**.
The **Topology** screen will appear and display the updated Topology Map.

Configuring Device Polling Settings

Devices in the assigned scan range can be discovered via SNMP and ICMP protocols. (The default polling interval of ICMP is 10 seconds, while SNMP is 60 seconds. Users can go to the **Device Settings Template** page to change the polling intervals.) After a device is discovered, MXview One will use SNMP and ICMP to poll the device periodically. To configure this function properly, you will need to know the following information:

NOTE

MXview One **Dashboard** widgets also use the device polling settings. For more information about the MXview One **Dashboard** widgets, see Chapter 5: **Dashboard Overview**.

1. Navigate to **Menu** (☰) > **Administration** > **Device Settings Template**.
The **Device Settings Template** screen appears.
2. Scroll down to the **Polling Settings** section.

Polling Settings

ICMP Polling Interval *

10

10 - 600 sec

SNMP Polling Interval *

60

60 - 600 sec

3. Configure the following ICMP polling settings:
ICMP polling interval: Specify the time in seconds between polls. MXview One will use ICMP protocol to check if the device is alive.
4. Configure the following SNMP polling settings:
SNMP polling interval: Specify the time in seconds between polls.
5. Scroll down to the **Log In** section to configure the device web console login credentials:
 - > **Username:** The login username for the device web console
 - > **Password:** The login password for the device web console

Log In

Username *

admin

Password *

....

6. Click **Save**.
MXview One will update the modified settings.

Changing Default SNMP Configuration

The default SNMP read community string that is used to discover devices is public. Use the Device Settings Template screen to change the default read community string or modify other default SNMP configuration.

1. Navigate to **Menu** (☰) > **Administration** > **Device Settings Template**.
The **Device Settings Template** screen will appear.
2. Scroll down to the **SNMP Configuration** section.

The screenshot shows the 'SNMP Configuration' section of the 'Device Settings Template' screen. It contains the following fields and values:

- SNMP Version ***: V1
- Port ***: 161
- Username**: admin
- Password**: (empty)
- Read Community**: public
- Write Community**: private
- Data Encryption**: NoAuth
- Authentication**: MD5
- Encryption Protocol**: DES
- Encryption Password**: (empty)

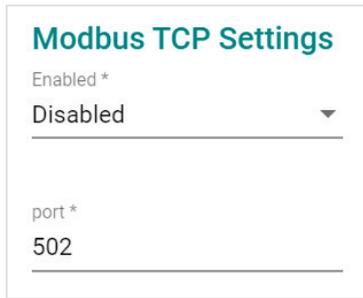

3. Configure the following:
 - a. **SNMP Version:** Select the SNMP protocol version
 - b. **SNMP Port:** Specify the SNMP port
 - c. **Username:** Specify the SNMP server username
 - d. **Password:** Specify the SNMP server password
 - e. **Read Community:** Specify the new community string
 - f. **Write Community:** Specify the new community string
 - g. **Data Encryption:** Select the data encryption method
 - NoAuth
 - AuthNoPriv
 - AuthPriv
 - h. **Authentication:** Select the authentication method
 - MD5
 - SHA
 - SHA256
 - SHA512
 - i. **Encryption Protocol:** Select the encryption protocol and input the Encryption Password.
 - DES
 - AES
4. Click **Save**.
MXview One updates the modified settings.

Changing Modbus TCP Settings

By configuring Modbus TCP Settings in the Device Settings Template section, MXview One will be able to detect whether a device has Modbus attributes or not. If a device supports Modbus, a Modbus string will appear above the device icon in the topology to easily identify the device.

1. Navigate to **Menu** (☰) > **Administration** > **Device Settings Template**.
The **Device Settings Template** screen will appear.

2. Scroll down to the **Modbus TCP Settings** section.

The screenshot shows a configuration window titled "Modbus TCP Settings". It contains two main sections: a status dropdown menu and a port input field. The status dropdown is labeled "Enabled *" and currently shows "Disabled" with a downward arrow. The port input field is labeled "port *" and contains the number "502".

3. Configure the following:
 - a. **Enabled:** Enable or disabled Modbus TCP settings
 - Enabled
 - Disabled
 - b. **Port:** Specify the Modbus TCP port
4. Click **Save**.

MXview One updates the modified settings.

7. Topology Management

MXview One allows you to view a graphical representation of your network topology, add/delete devices and links to the Topology Map, organize the topology structure, and export the Topology Map as a PNG image. You can also scan specific IP address ranges to discover devices on your network.

Topology Overview

The Topology screen allows you to view the Topology Map, which is a graphical representation of the devices in your network, and perform most actions in MXview One. For example, you can use the Network Topology screen to do the following:

- Display a graphical representation of a real network.
- Show connecting relationships between devices.
- Indicate the status of devices and links.

The screenshot displays the MXview One Topology Management interface. At the top, there is a navigation bar with the breadcrumb 'All > Site BRANDONYANG-PC > Root' and several menu items: 'Topology', 'Group', 'Edit', 'Visualization', and 'SFP'. Below the navigation bar is a search bar and a zoom control. The main area shows a network topology map with several devices and their connections. The devices are labeled with IP addresses and names: 'Ring Master' (192.168.127.104), 'Ring 1 Master' (192.168.127.93), 'Head' (192.168.127.114), and 'Head' (192.168.127.115). The connections are represented by lines with numbers 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50. Below the map is a checkbox 'Always show "Recent Events" at startup' and a search bar. At the bottom, there is a table of recent events.

Site Name	ID	Source	Source IP	Device Alias	Description	Time Issued
Site BRANDONYANG-PC	180	MXview One	192.168.127.169	192.168.127.169-AWK-4131A	Device SNMP reachable	2022-05-12 17:09:27

Viewing Topology Map

Use the Topology screen to view the Topology Map of your network.

1. Navigate to **Menu** (☰) > **Topology**.

The **Topology** screen will appear and displays the Topology Map by default.

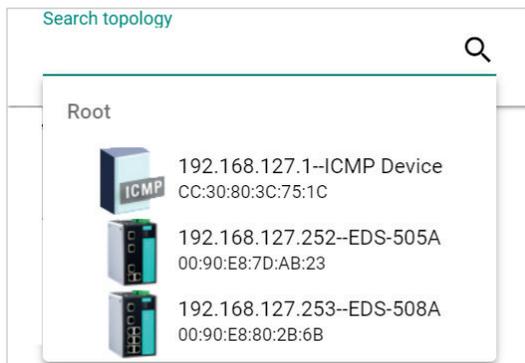

2. If the **List view** is displayed, click the **Topology view** (🗺️) icon in the top right corner.

The Topology screen will display a graphical representation of the devices and links on your network.

3. To search for a specific device on the Topology Map:

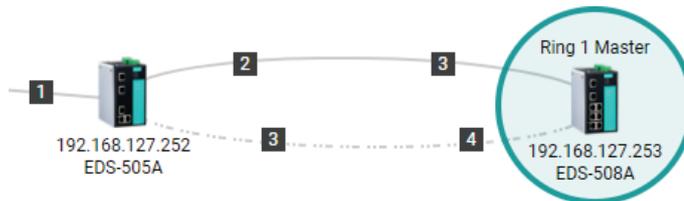

- a. Click the **Search topology** (🔍) icon in the top left corner.

The topology search box appears with a drop-down directory tree of the Topology Map structure.

- b. Search the device in the drop-down directory tree or type a string in the search box. Click the specific device and MXview One will bring you to the device on the Topology Map.

4. To view the details of a specific device, select the device in the Topology Map.

The **Device Properties** pane appears to the right of the Topology Map.

Device Properties Current Status

Basic Device Properties

Alias
EDS-510E

Model Name
EDS-510E

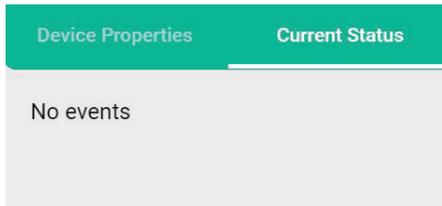

MAC Address
00:90:E8:86:2F:16

Availability
100.00%

System Description
EDS-510E-3GTXSFP

System Object ID
.1.3.6.1.4.1.8691.7.84

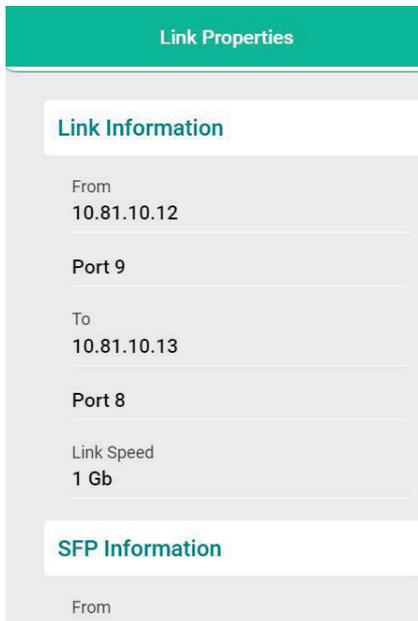

- To view events associated with the device, click the **Current Status**. The **Current Status** pane displays events associated with the device.

- To view details about a link between devices, select a link in your Topology Map.

The **Link Properties** pane appears to the right of the Topology Map.

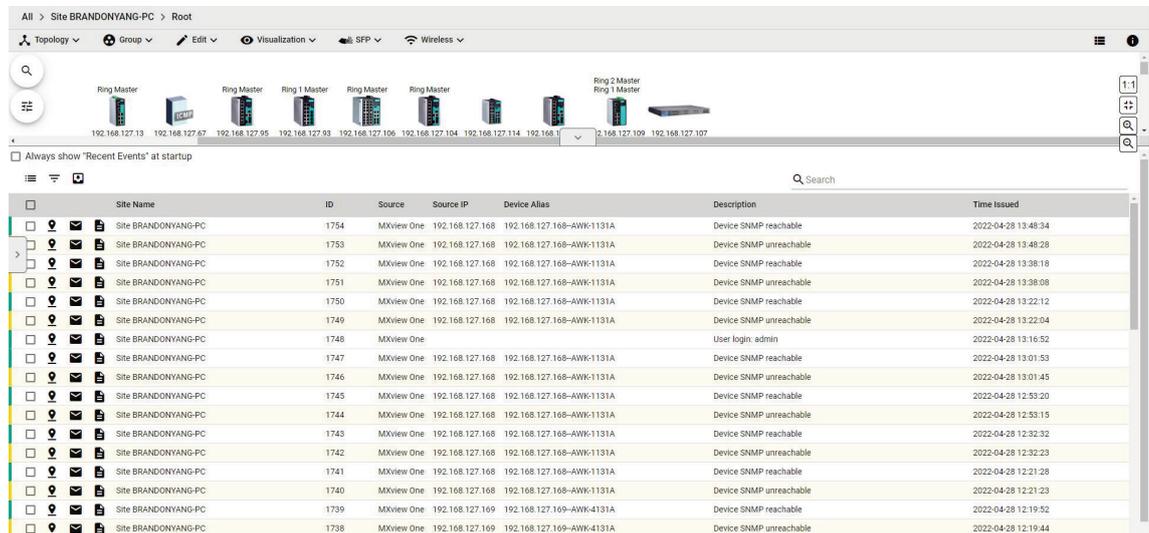

Viewing Recent Events

Use the **Topology** screen to view recent events from devices in your topology. You can filter the events in the list or export the data as a CSV file.

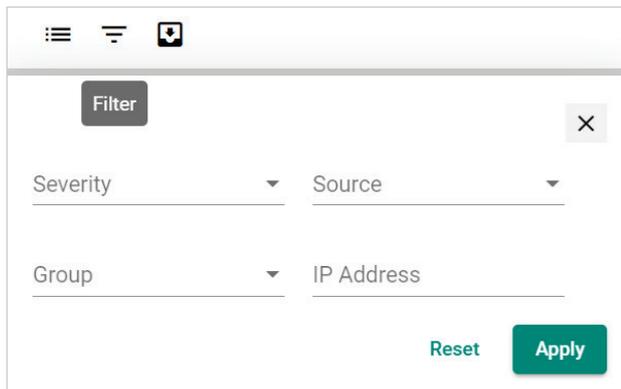

For more information on viewing all events, see Chapter 10: **Event Monitoring**.

1. Navigate to **Menu** (☰) > **Topology**.

The **Topology** screen will appear and displays the **Recent Events** panel on the bottom.

2. To filter the information in the table, type a full or partial string that matches the value in any of the table columns on the right of the search space.
MXview One filters the table to only display events with values that fully or partially match the specified string.
3. To filter the information in the table by specific criteria:
 - a. Click the **Filter** (☰) icon below the **Recent Events** tab.
The criteria selection screen appears.

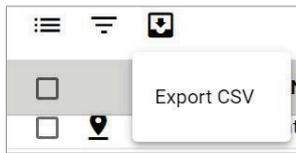

- b. Specify any of the following criteria:
 - Severity:** Select the event severity level
 - Any
 - Information
 - Warning
 - Critical
 - System Information

- Source:** Select the source that detected the event
 - Any
 - MXview One
 - Trap
 - Security Sensing
 - Group:** Select the device group
 - IP Address:** Select the device IP address
- c. Click **Apply**.
MXview One filters the table to only display events that match the specified criteria.
4. To acknowledge the events in the table:
- a. Click the Acknowledge (☑) icon before the specific event, then the event will be confirmed.
 - b. If you want to acknowledge more events, click the checkbox before the events or click the checkbox on the tool bar to select all the events. Then, click the Acknowledge icon.
5. To sort the data in the table by a specific column, click the column heading.
MXview One sorts the table by the column.

ID	Source	Source IP	Device Alias
43	MXview One	192.168.127.252	192.168.127.252-EDS-505A

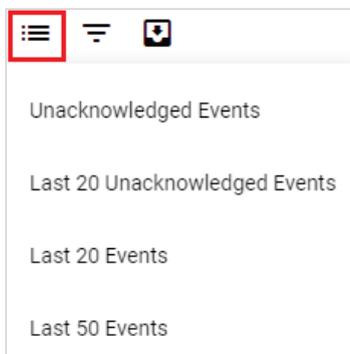

6. To export data displayed in the **Recent Events** tab:
- a. Click the **Export** (📄) icon.

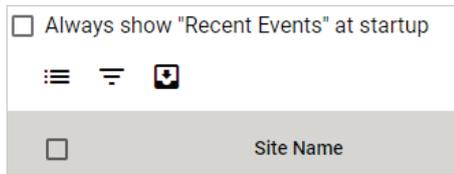

- b. Select **Export CSV**.
 - c. Specify the location to save the exported file.
 - d. Click **Save**.
MXview One exports the displayed event data as a CSV file.
7. To quickly filter event, click the **Quick filter event** (☰) icon to find the events.

The events include the following:

- Unacknowledged Events
- Last 20 Unacknowledged Events
- Last 20 Events
- Last 50 Events.

- MXview One allows users to display the Recent Events panel all the time by clicking the **Always show "Recent Events" at the startup** checkbox.

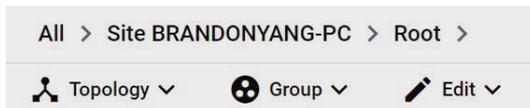

Organizing the Topology Structure By Group Function

The Topology Map can be organized into a multi-layer tree structure of up to 5 layers. Organizing the topology structure into groups helps manage a large number of nodes on the computer screen. For example, users can move nodes of the same subnet or location into the same group. Root, which is the only group at the first layer, exists by default and cannot be deleted. Groups created by users are in the layer under Root. Devices can be moved between groups.

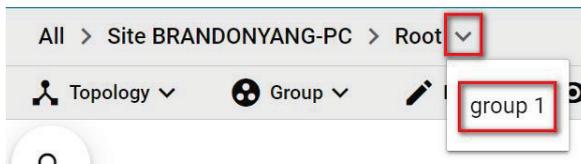

- Navigate to **Menu** (☰) > **Topology**.

The **Topology** screen appears and displays the Topology Map by default.

- MXview One represents the Topology Map structure by a path at the top of the **Topology** screen:

- If the Topology Map contains groups under the Root layer, you can click the right arrow (>) and select the group:

- You can also click the following icon used to indicate user-defined groups within the Topology Map:

- If **List view** is displayed, click the **Topology view** (👤) icon in the top right corner.

The **Topology** screen displays the following toolbar above the Topology Map:

3. To create a group:
 - a. Navigate to **Group > Create Group**.
The **Create Group** screen appears.

Create Group

Parent Group *
Root

Group Name *
group1

Group Description 6 / 63
Test

Image 4 / 128

The maximum image size is 1 MB

Cancel Create

- b. Configure the following:
 - Parent Group
 - Group Name
 - Group Description
 - Group Icon
 - c. Click **Create**.
MXview One will add the group below to the specified parent group.
4. To reorganize the groups within the Topology Map structure:
 - a. Navigate to **Group > Group Maintenance**.
The **Group Maintenance** screen appears.

Group Maintenance

+ -

▼ Root
group 1

Cancel Apply

- b. Select a layer to modify.

The group details appear to the right of the topology directory tree.

The screenshot shows the 'Group Maintenance' dialog box. On the left, there is a directory tree with 'Root' expanded and 'group 1' selected. On the right, there are input fields for 'Group Name *' (containing 'group 1', with a character count of 7 / 63) and 'Group Description' (with a character count of 0 / 128). Below these is an 'Image' section with a file upload icon, a refresh icon, and a network diagram icon. A note states 'The maximum image size is 1MB'. At the bottom right, there are 'Cancel' and 'Apply' buttons.

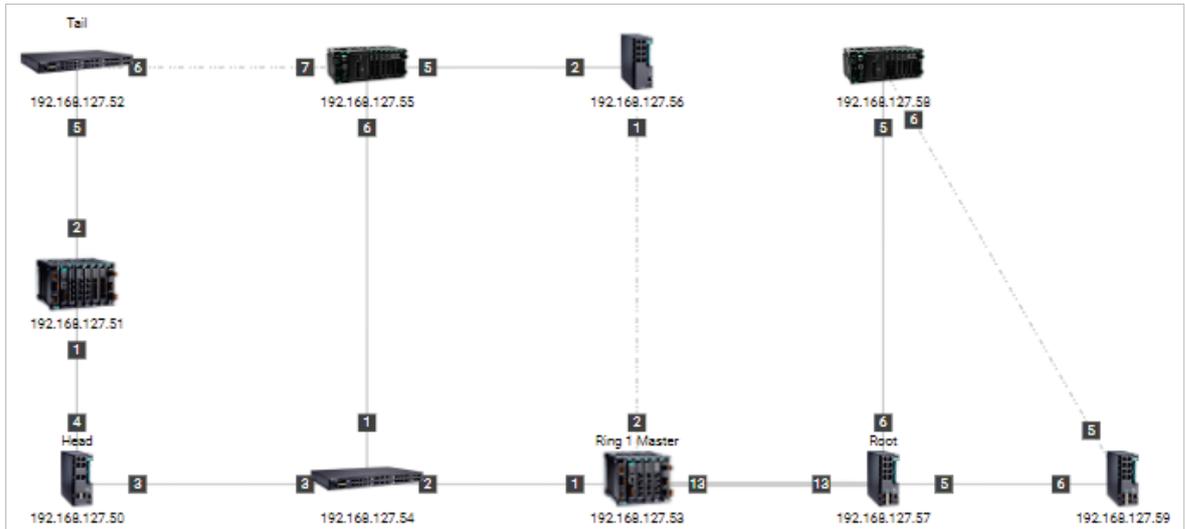

- c. (Optional) Edit the group details or perform one of the following points:
- (Optional) Click **Add** to add a new group below the selected layer.
 - (Optional) Click **Delete** to remove a group from the topology structure.
- d. Click **Apply**.
5. To reassign the device(s) in a group:
- There are two ways to reassign the device(s) in a group:
 - Navigate to Group > **Change Group**. The Change Group screen appears.
 - Select the device(s) you want to reassign on the topology and click the Change Group icon on the toolbar.

The screenshot shows the 'Change Group' dialog box. At the top, there is a 'Current Group *' dropdown menu set to 'Root'. Below this is a list of IP addresses, each with a checkbox: 192.168.127.154, 192.168.127.155, 192.168.127.156, 192.168.127.157, 192.168.127.158, 192.168.127.159, 192.168.127.160, 192.168.127.161, and 192.168.127.162. Below the list, it says '0 Selected / 50 total'. At the bottom, there is an 'Assign to Group *' dropdown menu set to 'group 1'. At the bottom right, there are 'Cancel' and 'Apply' buttons.

- If the **IP Address** list does not display the IP address(es) of the device(s) you want to reassign, select the **Current Group** drop-down list.
- Select the IP address(es) of the device(s) that you want to reassign to a different group.
- From the **Assign to Group** drop-down list, select the new group for the selected device(s).
- Click **Apply**.

Redundant Topologies

Redundant topologies have at least one backup link, which will be indicated with a dashed line:

For devices that play a particular role in the topology, MXview One will label the devices by displaying the roles above the images of the devices. Backup links will be indicated with dashed lines.

- RSTP has a **Root**
- Turbo Ring has a **Master**
- Turbo Chain has a **Head** and a **Tail**
- Dual Homing

NOTE

Only the **Auto Topology** function can draw dashed lines for redundancy links. Redundant links that are added manually will appear as solid lines.

PoE Power Consumption Visualization

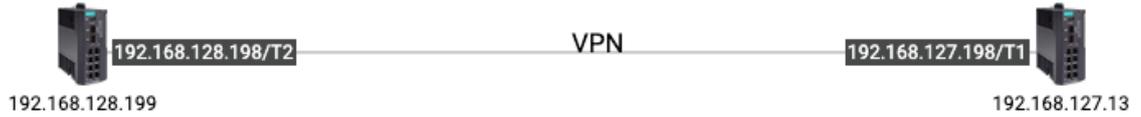

By periodic polling, a PoE link will display the port number, power (watts), voltage (V), and current (mA) directly on the topology map.

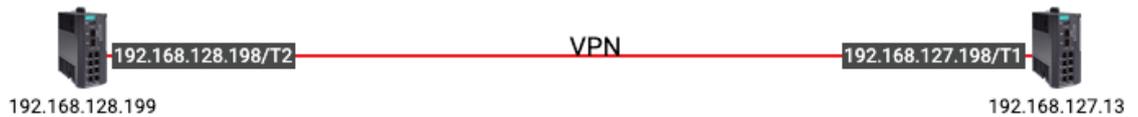

VPN Tunnel Visualization

The VPN tunnel link will display 'VPN' on the link.

1. The VPN tunnel is connected.

2. The VPN tunnel is disconnected.

NOTE

VPN Tunnel Visualization is only available on Moxa's EDR-810 and EDR-G9010 series of secure routers.

Port Trunking

Port trunking, also called link aggregation, involves grouping links into a link aggregation group. Trunking links will be indicated with thick, solid lines.

NOTE

Only **Auto Topology** can draw thick lines for trunking links. Trunking links that are added manually will appear as solid lines.

NOTE

For trunked link, check **Device Properties** to get the port number corresponding to the trunking information.

Adding Devices and Links

MXview One allows you to manually add devices and links to an automatically generated Topology Map. The **Topology** screen allows you to add devices from Topology View or List View.

For information about List View, see Chapter 10: **Device Management** > **Viewing the Device List**.

1. Navigate to **Menu** (☰) > **Topology**.

The **Topology** screen appears and displays the Topology Map by default.

2. To add a device to the Topology Map:
 - a. Click **Edit > Add Device**.

The **Add Device** screen will appear.

Add Device

IP Address *

Assign Model * Assign to Group * ▾

SNMP Version * Port *
V1 161

Username
admin Password

Read Community Write Community
public private

Data Encryption Authentication
NoAuth MD5

Encryption Protocol Encryption Password
DES

Cancel Add

- b. Configure the following:

- IP Address:** Specify the IP address of the device
- Assign Model:** Select the model of the device
- Assign to Group:** Select the group to assign the device to
- SNMP Version:** Select the SNMP version
- Port:** Specify the port number
- Username:** Specify the device login Username
- Password:** Specify the password
- Read Community:** Specify the SNMP read community string
- Write Community:** Specify the SNMP write community string
- Data Encryption:** Select the data encryption method
- Authentication:** Select the authentication method
- Encryption Protocol:** Select the encryption protocol and input the **Encryption Password**

- c. Click **Add**.

MXview One adds the device to the topology.

3. To add a link to the Topology Map:
 - a. Navigate to **Edit > Add Link**.
The **Add Link** screen will appear.

Add Link

From

Device *

Port *

To

Device *

Port *

[Cancel](#) [Add](#)

- b. Configure the following information for the two devices joined by the link:
 - Device:** Specify the IP address of the device
 - Port:** Specify the device port number
- c. Click **Add**.
MXview One adds the link between the specified devices.

NOTE

Links drawn between two devices in the Topology Map are bidirectional. You may specify either device as the **From** device or the **To** device.

NOTE

Trunking and redundancy links added manually will appear as solid lines.

NOTE

Port numbers must be numeric and entered correctly to obtain the correct traffic information.

NOTE

For modular switches, a port number depends on the chassis to which the port belongs, but not on how many modules are inserted. For switches such as the PT-7828, the first module's port numbers are from 1 to 8, the second module's port numbers are from 9 to 16, and so on. The port number depends only on which slot the module is in; in other words, the port number is the same regardless of whether other slots are empty or occupied.

Deleting Devices and Links

You can delete devices and links from the Topology Map. After a device is deleted, it will be removed from the topology map, and the device will not be polled or located when performing Device Discovery. Deleting a link will delete a link from the topology map, but it will not affect the actual network configuration.

1. Navigate to **Menu** (☰) > **Topology**.

The **Topology** screen will appear and display the Topology Map by default.

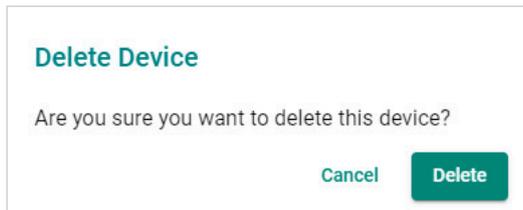

2. To delete a device from the Topology Map:
 - a. Select the device.

The following toolbar menu will appear.

- b. Click **Delete**.

A confirmation screen will appear.

- c. Click **Delete**.

MXview One deletes the device from the Topology Map.

3. To delete a link from the Topology Map:

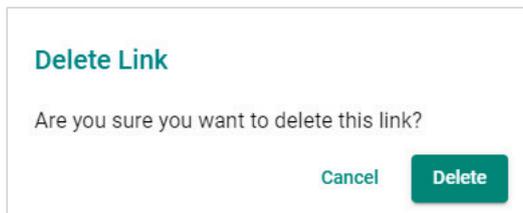

- a. Select the link.

The following toolbar menu will appear.

- b. Click **Delete**.

A confirmation screen will appear.

- c. Click **Delete**.

MXview One deletes the link from the Topology Map.

Updating the Topology Map

Updating the existing topology adds new links and updates existing links, but does not change the status of links that are indicated as having been disconnected or links that were drawn manually.

For devices with LLDP functionality, MXview One can draw the physical topology map, down to the port level of the devices. For devices without an LLDP MIB, MXview One is able to draw links by using ARP. To activate this function, select the **Advanced Topology Analysis** checkbox from the **Auto Topology** screen.

1. Navigate to **Menu** (☰) > **Topology**.

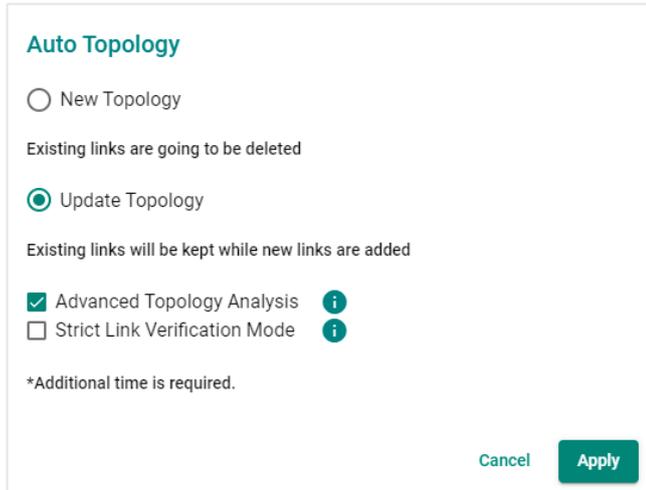

The **Topology** screen appears and displays the Topology Map by default.

2. If **List view** is selected, click the **Topology view** (🔗) icon in the top right corner.

The **Topology** screen displays a graphical representation of the devices and links on your network.

3. Navigate to **Topology > Auto Topology**.

The **Auto Topology** screen appears.

4. Select **Update Topology**.
5. (Optional) Select **Advanced Topology Analysis** to draw links for devices without an LLDP MIB.
6. (Optional) Select **Strict Link Verification Mode**. If enabled, links between devices will only be shown on the topology if the devices on both ends have the other device's information in their LLDP table.
7. Click **Apply**.
MXview One will update the Topology Map.

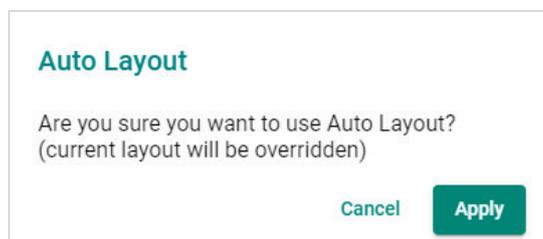

NOTE

MXview One cannot guarantee that it can draw the link of the topology for non LLDP devices. However, you can draw the link of the topology manually by clicking **Add Link**.

Refreshing the Topology Layout

After changes have been made, use the **Auto Layout** feature to refresh the layout of the Topology Map. Auto Layout does not update any devices or links. It only redraws the topology to better fit the screen.

1. Navigate to **Menu (☰) > Topology**.
The **Topology** screen will appear and displays the Topology Map by default.
2. If **List view** is selected, click the **Topology view** (🗺️) icon in the top right corner.
The **Topology** screen will display a graphical representation of the devices and links on your network.
3. Navigate to **Topology > Auto Layout**.
The **Auto Layout** screen appears.

4. Click **Apply**.
MXview One refreshes the Topology Map layout.

Creating a New Topology Map

Creating a new topology deletes all links, requests LLDP information from devices, and draws topology maps based on the gathered information.

For devices with LLDP functionality, MXview One can draw the physical topology map, down to the port level of the devices. For devices without an LLDP MIB, MXview One is able to draw links by using ARP. To activate this function, select the **Advanced Topology Analysis** checkbox from the **Auto Topology** screen.

NOTE

Links drawn manually will also be deleted by this action.

NOTE

Your devices must have firmware version 3.1 or higher to use **Advanced Topology Analysis**.

NOTE

If the Auto Topology function does not create an accurate representation of the actual network, deselect the **Advanced Topology Analysis** check box and try again.

1. Navigate to **Menu** (☰) > **Topology**.
The **Topology** screen appears and displays the Topology Map by default.
2. If **List view** is selected, click the **Topology view** (🗺️) icon in the top right corner.
The **Topology** screen displays a graphical representation of the devices and links on your network.
3. Navigate to **Topology** > **Auto Topology**.
The **Auto Topology** screen appears.

Auto Topology

New Topology

Existing links are going to be deleted

Update Topology

Existing links will be kept while new links are added

Advanced Topology Analysis 

Strict Link Verification Mode 

*Additional time is required.

Cancel

Apply

4. Select **New Topology**.
5. (Optional) Select **Advanced Topology Analysis** to draw links for devices without an LLDP MIB.
6. Click **Apply**.
MXview One will create a new Topology Map.

NOTE

MXview One cannot guarantee that it can draw the link of the topology for non LLDP devices. However, you can draw the link of the topology manually by clicking **Add Link**.

Setting/Editing the Background Image

MXview One allows you to customize the Topology Map by uploading a background image in JPG, GIF, or PNG format.

1. Navigate to **Menu** (☰) > **Topology**.
The **Topology** screen appears and will display the Topology Map by default.
2. If **List view** is selected, click the **Topology view** (🌐) icon in the top right corner.
The **Topology** screen will display a graphical representation of the devices and links on your network.
3. Navigate to **Edit** > **Background**.
The **Background** screen appears.

4. Upload the background image by using one of the following methods:
 - The image size must be less than 20 MB.
 - Click **Set Background** (📁) icon to upload the image file.
MXview One will set the uploaded image as the Topology Map background.
5. Use the sliders to modify the **Alpha** and **Saturation** value of a background image.

- Under the **Position** section, modify the value of X and Y to move the origin of the image to a suitable location. Modify the 'Width' and 'Height' to change the size of the image.

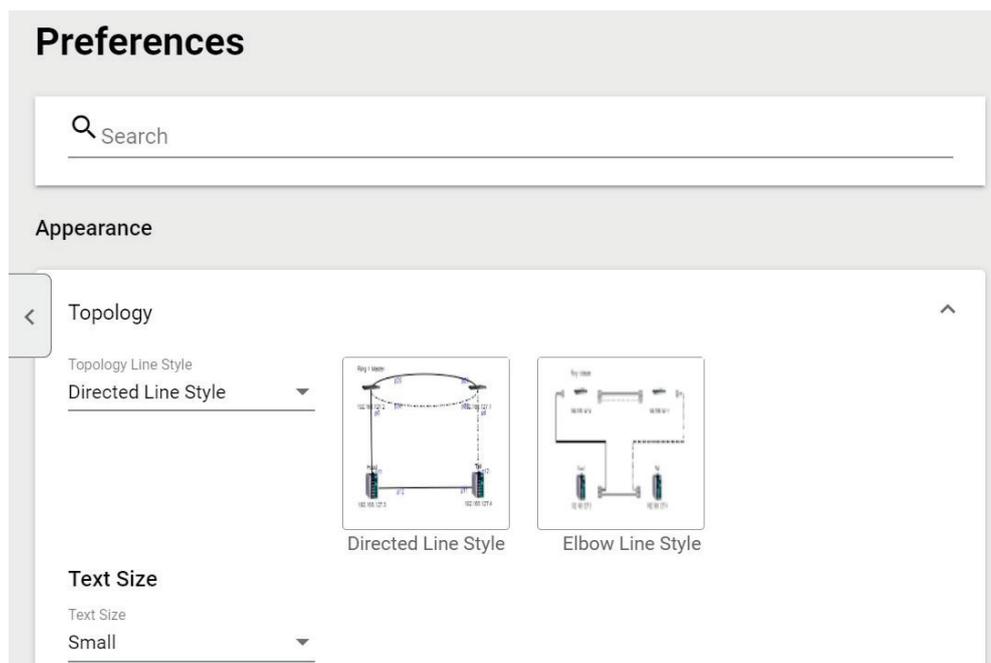

- To delete a background image, click (🗑️) to remove the background image from the Topology Map.

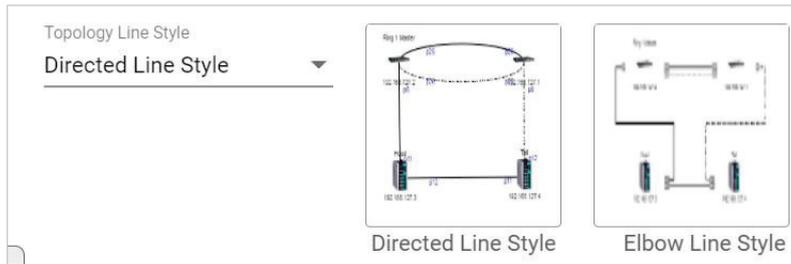

Editing the Topology Appearance

Use the **Preferences** screen to modify how the Topology Map displays the topology line style, PoE status, background color, link status, and traffic load.

- Navigate to **Menu** (☰) > **Administration** > **Preferences**.
The **Preferences** screen appears.
- In the **Appearance** section, expand **Topology**.
The **Topology** settings appear.

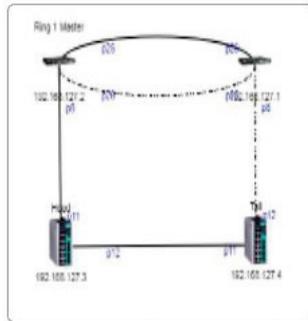

- To modify the Topology Line Style, select one of the following from the drop-down list:

➤ **Directed Line Style**

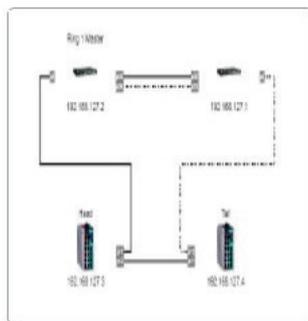

MXview One applies the following style to the lines indicating the links between devices in the Topology Map:

Directed Line Style

➤ **Elbow Line Style**

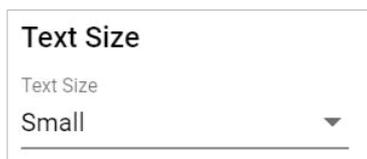

MXview One applies the following style to the lines indicating the links between devices in the Topology Map:

Elbow Line Style

- To modify the text size in MXview One:
Select one of the following from the drop-down list:

- Large
- Medium
- Small

5. To modify how MXview One displays Power-over-Ethernet (PoE) links:
 - a. Select the **Show PoE Status on Topology** check box to indicate the PoE link status on the Topology Map.

PoE

Show PoE Status on Topology

PoE Link Color

- b. Click the **PoE Link Color** field and specify a new color.

PoE

Show PoE Status on Topology

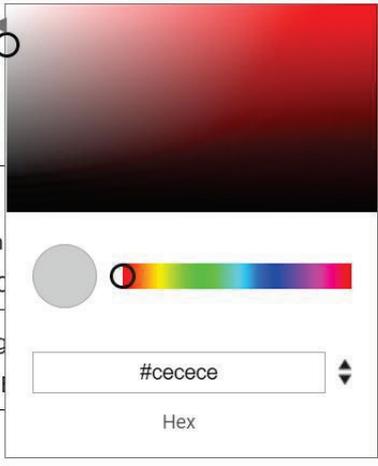

PoE Link Color

Background

Background Color

Status Color

Link Up	Link Down
<input type="text" value="#CECECE"/>	<input type="text" value="#FF0000"/>
Turbo Ring V1	Turbo Ring V2
<input type="text" value="#CECECE"/>	<input type="text" value="#CECECE"/>
Turbo Chain	RSTP
<input type="text" value="#CECECE"/>	<input type="text" value="#CECECE"/>

#cecece

Hex

- c. (Optional) Clear the **Show PoE Status on Topology** check box to hide the PoE link status on the Topology Map.

PoE

Show PoE Status on Topology

PoE Link Color

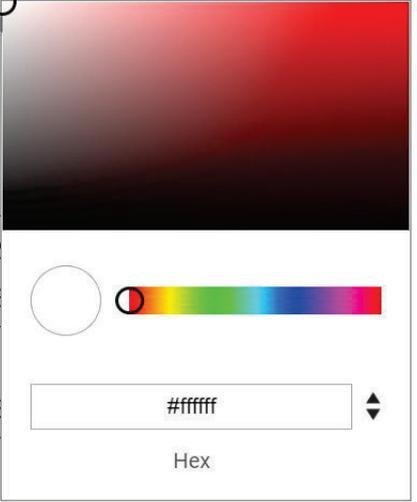

6. To modify the Topology Map background, click the Background Color field and specify a new color.

Background

Background Color

Status Color

Link Up	Link Down
<input type="text" value="#CECECE"/>	<input type="text" value="#FF0000"/>
Turbo Ring V1	Turbo Ring V2
<input type="text" value="#CECECE"/>	<input type="text" value="#CECECE"/>

<input type="text" value="#CECECE"/>	<input type="text" value="#CECECE"/>
PRP LAN A	PRP LAN B
<input type="text" value="#CECECE"/>	<input type="text" value="#CECECE"/>

#ffffff

Hex

7. To modify the color used to indicate the status of specific links in the Topology Map, click to modify the **Status Color** hex code for any of the following links:
 - Link Up
 - Link Down
 - Turbo Ring V1
 - Turbo Ring V2
 - Turbo Chain
 - RSTP
 - PRP/Coupling LAN A
 - PRP/Coupling LAN B
 - HSR Ring

Status Color	
Link Up #CECECE	Link Down #FF0000
Turbo Ring V1 #CECECE	Turbo Ring V2 #CECECE
Turbo Chain #CECECE	RSTP #CECECE
PRP LAN A #008000	PRP LAN B #0000FF
HSR Ring #800080	

NOTE

The three status colors (**PRP LAN A**, **PRP LAN B**, **HSR Ring**) will appear when you activate the MXview Power license.

8. Click **Save**.
MXview One will update the modified settings.

Editing the Device Appearance

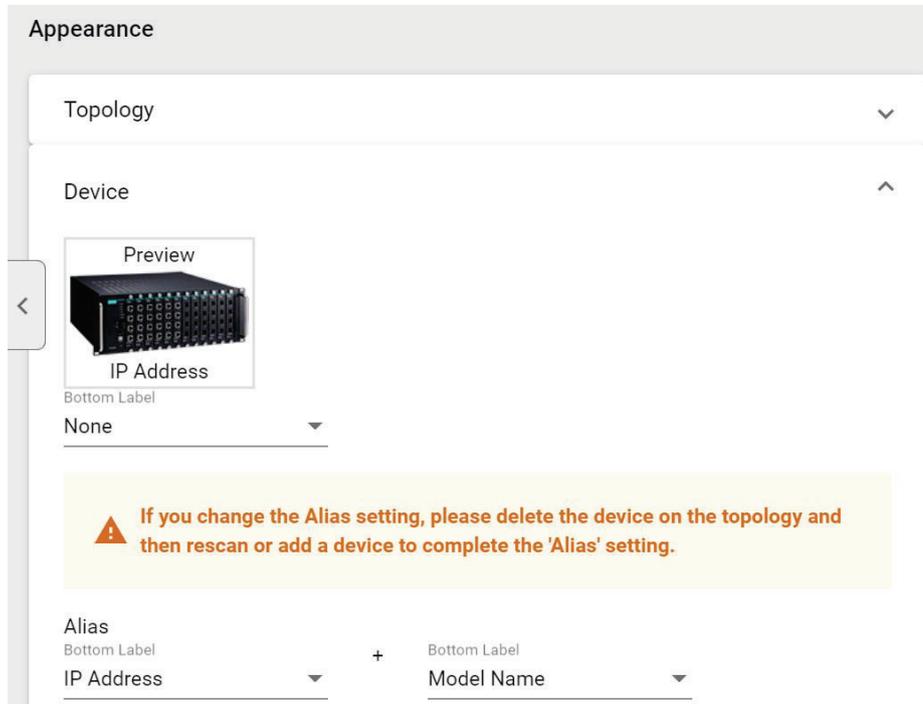

Use the **Preferences** screen to modify how devices appear in the Topology Map.

1. Navigate to **Menu** (☰) > **Administration** > **Preferences**.

The **Preferences** screen will appear.

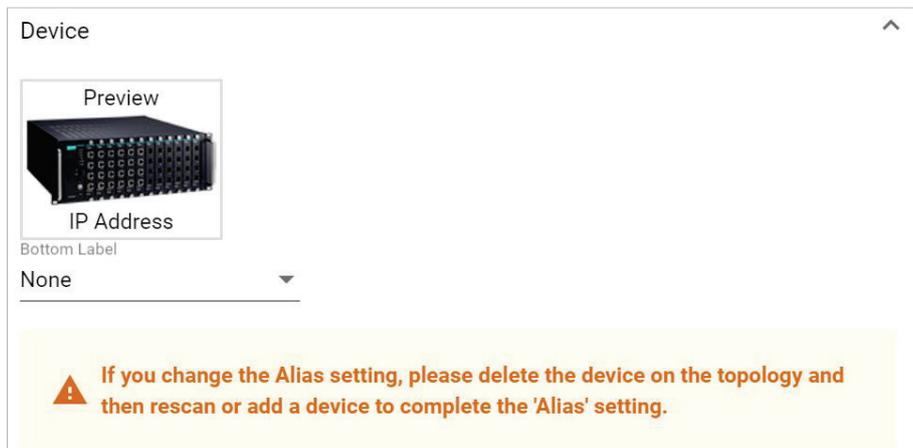

2. In the **Appearance** section, expand **Device**.

The **Device** settings will appear.

3. To modify the label that indicates the device in the Topology Map:

- a. Locate the **Bottom Label** drop-down list located below the Preview image:

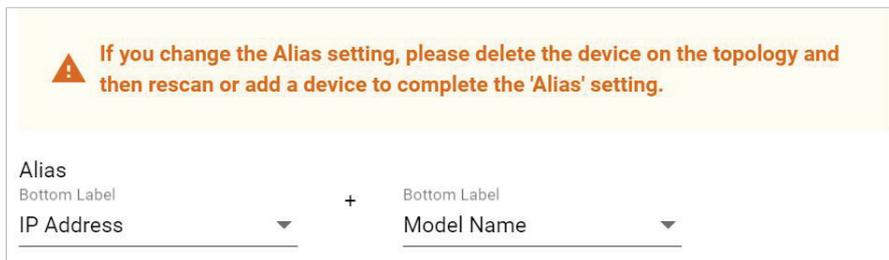

b. Select one of the following properties from the **Bottom Label** drop-down:

- Location
- Alias
- Model Name
- MAC

MXview One displays the selected property below the IP address of the device.

4. To modify the device alias:
- a. Locate the **Alias** section.

b. From the first drop-down list in the Alias section, select one of the following:

- IP Address
- MAC
- Model Name
- Location
- SysName

c. From the second drop-down list in the Alias section, select one of the following:

- IP Address
- MAC
- Model Name
- Location
- SysName

NOTE

If you change the Alias setting, please delete the device on the topology and then rescan or add a device to complete the 'Alias' setting.

5. Click **Save**.

MXview One updates the modified settings.

Exporting the Topology Map

MXview One allows you to export the Topology Map as a PNG image.

1. Navigate to **Menu** (☰) > **Topology**.

The **Topology** screen appears and displays the Topology Map by default.

2. If **List view** is selected, click the **Topology view** (🌐) icon in the top right corner.

The **Topology** screen will display a graphical representation of the devices and links on your network.

3. Navigate to **Edit** > **Export Topology**.

MXview One exports the PNG image of the Topology Map.

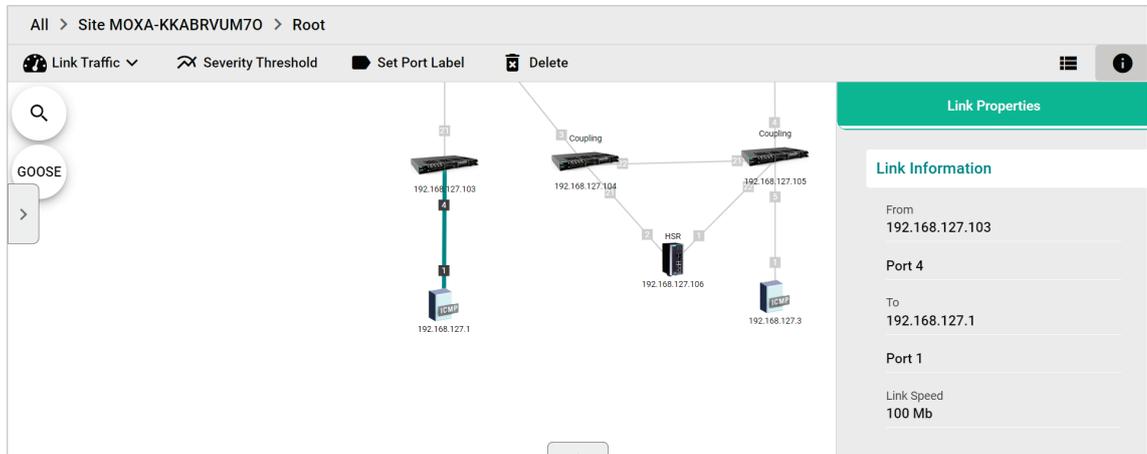

8. Network and Traffic Monitoring

MXview One allows you to monitor the traffic between devices on your network and trigger events for specific traffic conditions. You can apply topology views to monitor traffic load, network security, as well as wireless access points and clients.

Viewing Link Properties

Click a link on the Topology Map to view link properties and perform the following:

1. Navigate to **Menu** (☰) > **Topology**.
The **Topology** screen will appear and display the Topology Map by default.
2. Click on a link between devices in the Topology Map.
The **Link Properties** pane appears to the right of the Topology Map.

Viewing Port Traffic

The **Port Traffic** screen displays a graph that shows the utilization percentage (Y-axis) over a specific time period (X-axis). You can also adjust the time period for the data that is displayed by changing the starting date and ending date. The minimum interval you can select is one day and the maximum interval you can select is 90 days.

1. Navigate to **Menu** (☰) > **Topology**.

The **Topology** screen appears and displays the Topology Map by default.

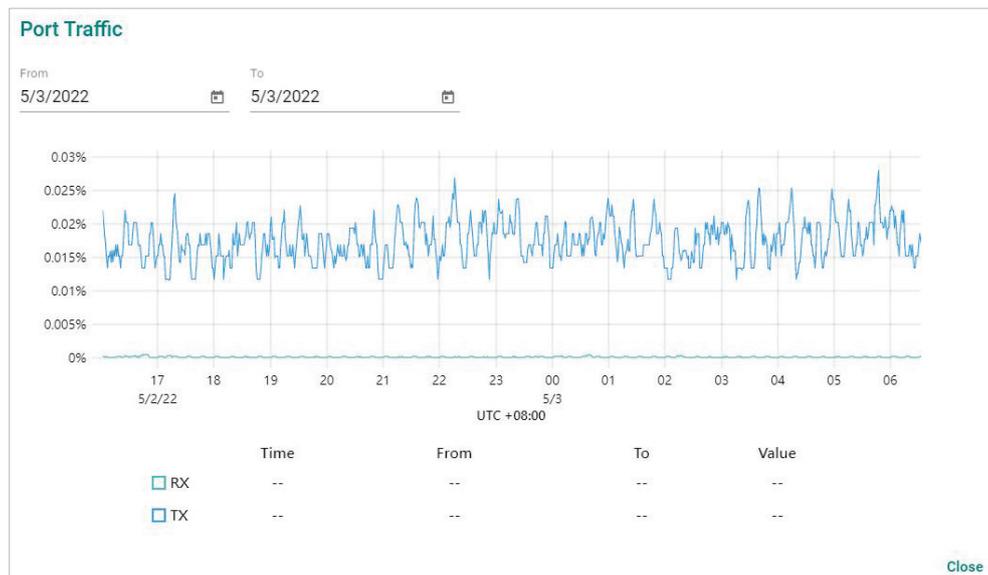

2. Click on a link between devices in the Topology Map.

The **Link Properties** pane and the following toolbar appear when a link is selected.

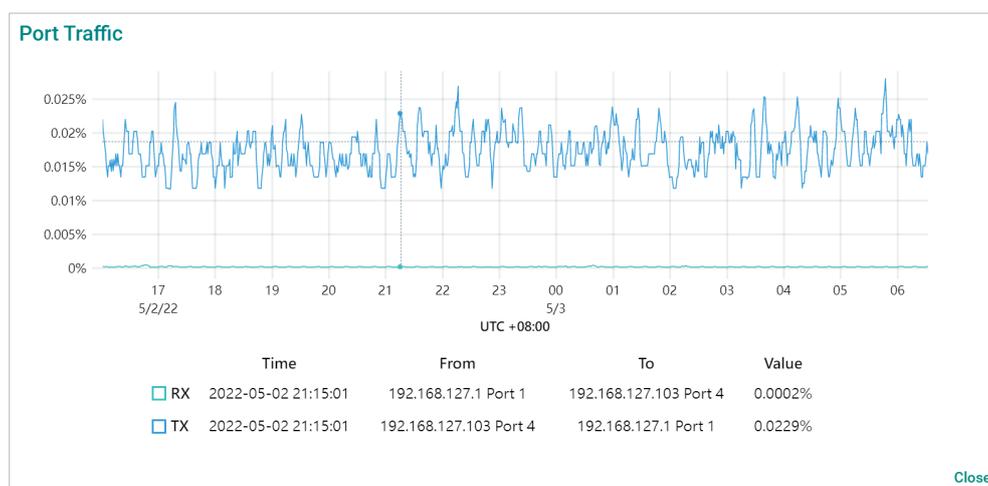

3. Navigate to **Link Traffic** > **Port Traffic**.

The **Port Traffic** screen will appear.

4. To adjust the time period for the graph data:
 - a. Click the **From** date and select a new starting date.
 - b. Click the **To** date and select a new ending date.
5. Hover over a line to view the direction of traffic.

For example, the green line at the top of the following graph represents traffic from **192.168.127.1 (device IP address) Port 1 to 192.168.127.103 (device IP address) Port 4**.

Viewing Packet Error Rates

The **Packet Error Rate** screen displays a graph that shows the packet error rate (Y-axis) over a specific time period (X-axis). You can also adjust the time period for the data that is displayed by changing the start and end dates. The minimum interval is one day and the maximum interval you can select is 90 days.

1. Navigate to **Menu** (☰) > **Topology**.

The **Topology** screen appears and displays the Topology Map by default.

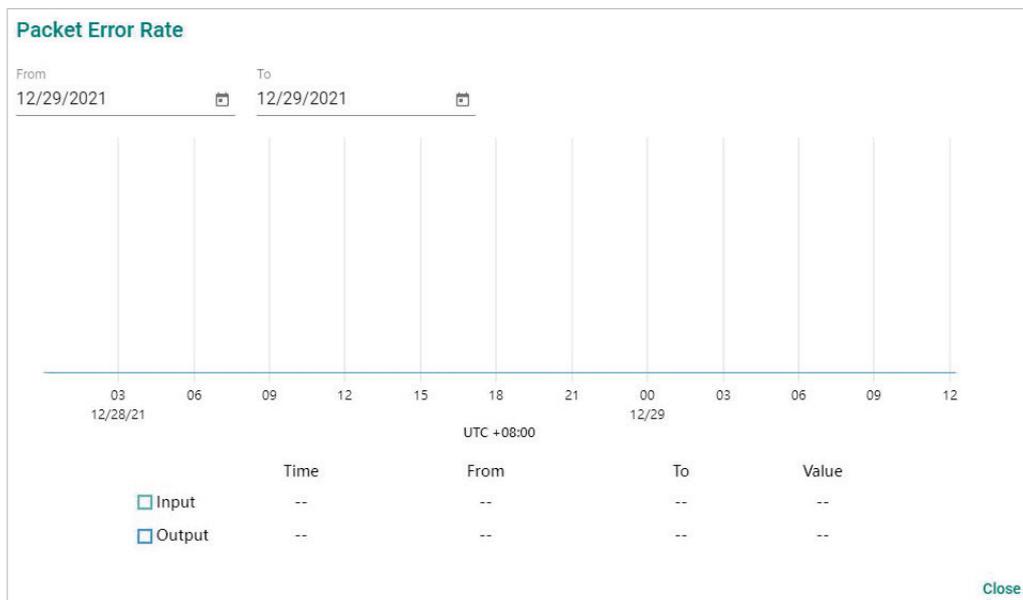

2. Click on a link between devices in the Topology Map.

The **Link Properties** pane and toolbar appear when a link is selected.

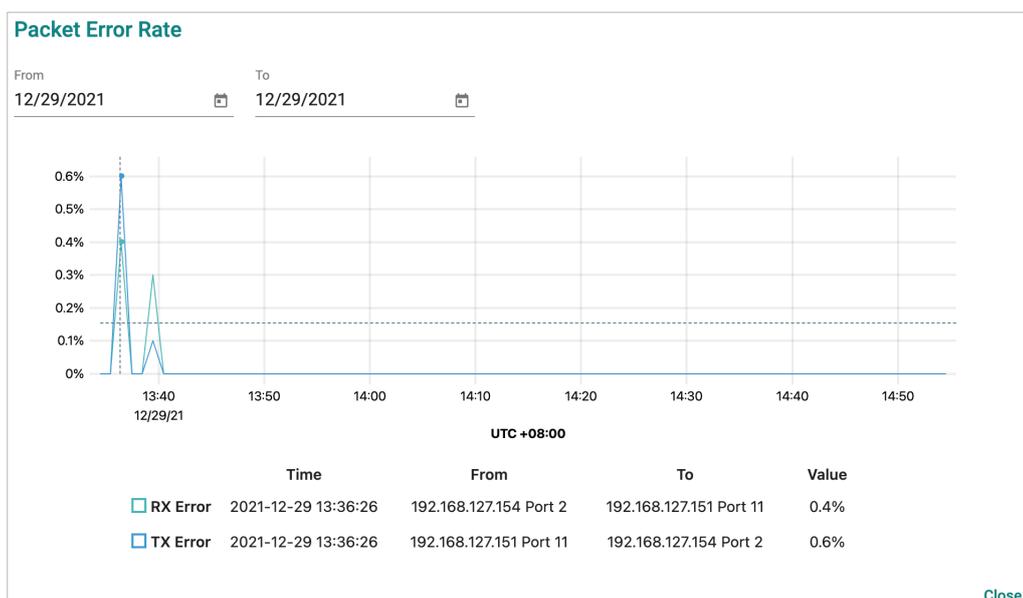

3. Navigate to **Link Traffic** > **Packet Error Rate**.

The **Packet Error Rate** screen appears.

4. To adjust the time period for the graph data:
 - a. Click the **From** date and select a new starting date.
 - b. Click the **To** date and select a new ending date.
5. Hover over a line to view the packet error rate.

Monitoring Traffic Loads

MXview One collects the traffic load information of every link and displays the information to provide users with a network-wide view.

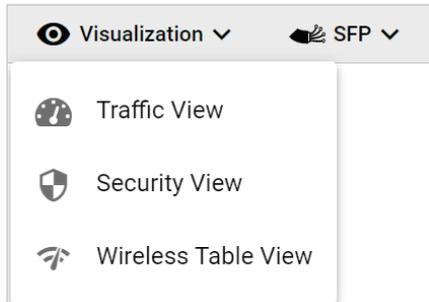

1. Navigate to **Menu** (☰) > **Topology**.

The **Topology** screen will appear and displays the Topology Map by default.

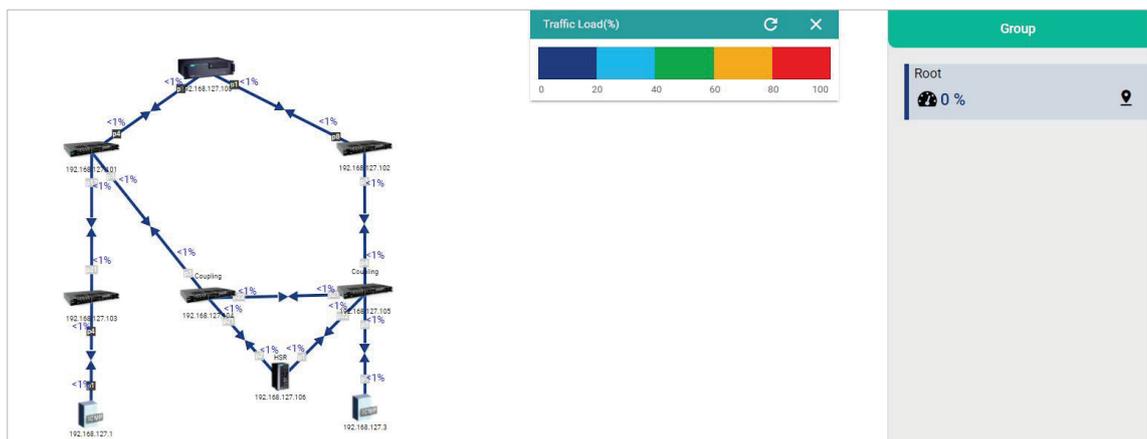

2. If **List view** is selected, click the **Topology view** (🗺️) icon in the top right corner.

The **Topology** screen will display a graphical representation of the devices and links on your network.

3. From the toolbar menu, navigate to **Visualization** > **Traffic View**.

The **Traffic Load** legend will appear and the Topology Map color-codes each link to indicate the traffic load.

Monitoring Network Security

ISA/IEC 62443 is a continuously evolving cybersecurity standard whose guidelines have already been adopted in many industrial automation applications. This standard, including its subsections, aims to cover points such as general requirements, policies and procedure, system-level requirements, and component-level requirements.

Moxa's MXview One follows Moxa's security guidelines, which are based on the IEC 62443-4-2 component-level recommendations. Security View checks the security level of Moxa's network devices. There are five levels for checking the results in Security View:

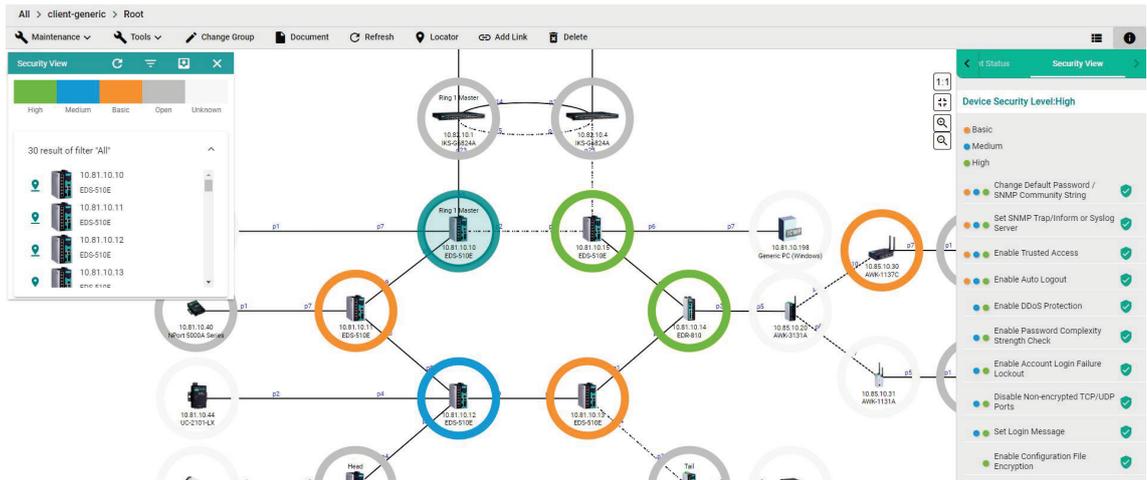

- High
- Medium
- Basic
- Open: Security Level below basic
- Unknown: Devices without security-related information for MXview One

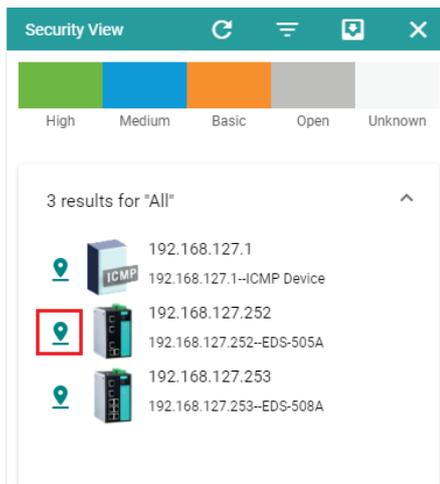

NOTE

The definition of general baseline is based on several industrial cybersecurity policies and requirements.

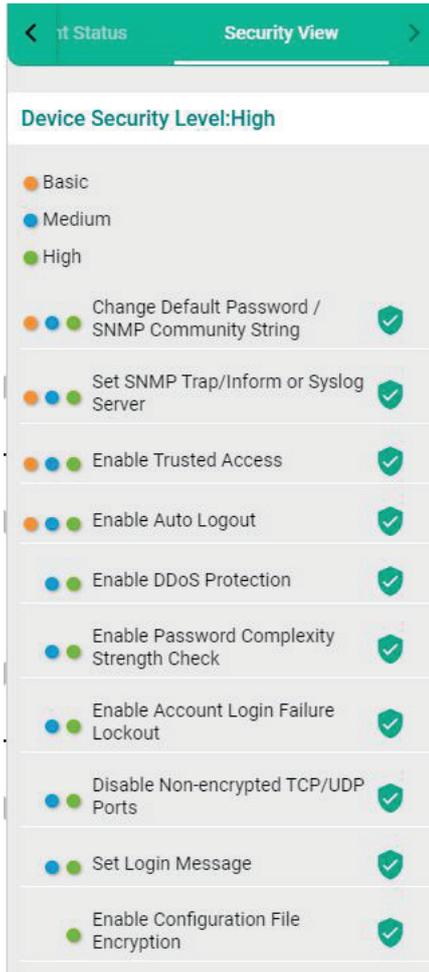

1. Navigate to **Menu** (☰) > **Topology**.
The **Topology** screen will appear and display the Topology Map by default.
2. If **List view** is selected, click the **Topology view** (🗺️) icon in the top right corner.
The **Topology** screen will display a graphical representation of the devices and links on your network.
3. From the toolbar menu, navigate to **Visualization** > **Security View**.
The **Security View** window will appear and the Topology Map indicates the security level of each device with a color-coded circle.

4. To filter the devices in the **Security View** window by security level:
 - a. Click the **Filter** (≡) icon.
 - b. Select the security level.
The **Security View** window filters the list of devices to only show devices that match the selected security level.
5. To locate a device in the Topology Map, click the device in the Security View window.

The **Security View** details pane will appear on the right and the Topology Map highlights the circle around the device.

6. View security details for a specific device by using one of the following methods:
 - Select a device from the Topology Map.
 - Select a device from the **Security View** window.

The **Security View** details pane will appear and displays the device security level and security-related configuration statuses.

7. View the Security View Report:

Click **Export** to export the Security View Report in either CSV or PDF format.

8. Review the following items in the Security View details pane:

Item	Description
Enable Auto Logout	Check if the Auto Logout function is enabled.
Set Login Message	Check if both the Web Login Message and Web Login Fail Message are configured.
Disable Non-encrypted TCP/UDP Ports	Check if non-encrypted TCP/UDP Ports are disabled. HTTP, Telnet, and Moxa Proprietary Protocol should be disabled. SNMP must be set to V3 only.
Enable Account Login Failure Lockout	Check if the Account Login Failure Lockout function is enabled.
Enable Trusted Access	Check if the Trusted Access function is enabled or not. At least one rule must be set.
Enable Password Complexity Strength Check	Check if the Password Complexity Strength Check function is enabled.
Enable Configuration File Encryption	Check if the Configuration File Encryption function is enabled. At least one rule must be enabled.
Enable DDoS Protection	Check if Broadcast Storm Protection is enabled. For eCos switches, MXview One checks whether Broadcast Storm Protection is enabled. For EDR routers, MXview One checks whether at least one form of DoS protection is enabled. For MXnos switches, MXview One checks whether at least one of the following is enabled: Broadcast, Multicast, or DLF protection.
Set SNMP Trap/Inform or Syslog Server	Check if the SNMP Trap/Inform or Syslog Server is set.
Change Default Password/SNMP Community String	Check if the Default Password or SNMP Community String is set.
Enable SSL/TLS High Secure Mode	Check if the HTTPS is enabled and HTTP is disabled.

NOTE

Users can use Security Wizard function in MXconfig to easily set the Security View status of devices.

9. To modify the colors used to indicate the security levels:
- Navigate to **Menu** (☰) > **Administration** > **Preferences**.
The **Preferences** screen will appear.
 - Under the **Appearance** section, expand **Security View**.
 - In the **Colors for check result** section, modify the color used to indicate a security level.

Security View ^

Profile
Built-in Profile [Profile details](#)

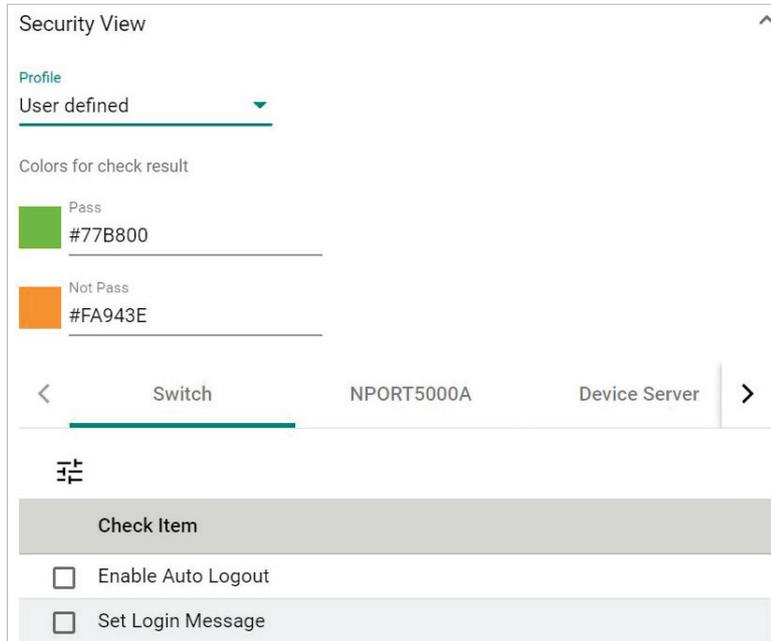

Colors for check result

<p>High ■ #77B800</p>	<p>Medium ■ #009DDB</p>
<p>Basic ■ #FA943E</p>	<p>Open ■ #C0C0C0</p>

Save

- Click **Save**.

10. To define a custom security profile:
 - a. Navigate to **Menu** (☰) > **Administration** > **Preferences**.
The **Preferences** screen will appear.
 - b. Under the **Appearance** section, expand **Security View**.
 - c. From the **Profile** drop-down list, select **User defined**.
The user-defined profile settings will appear.

- d. (Optional) Modify the colors for the check result.
- e. Click one of the following device tabs to configure the profile settings:
 - Switch
 - NPORT5000A
 - Device Server
 - Terminal Server
 - Gateway
 - Wireless
 - IO
- f. (Optional) Click the **Settings** (⚙️) icon to select a baseline.
- g. Select the check box for each item you want to add to security profile.
- h. Click **Save**.

Configuring Severity Thresholds for Traffic and Fiber Status Monitoring Events

MXview One allows you to configure the following traffic conditions on a link to trigger events:

- Bandwidth utilization is over the threshold.
- Bandwidth utilization is under the threshold.
- Packet error rate is over the threshold.
- Fiber Rx is under the threshold.
- Fiber Tx is under the threshold.
- Fiber temperature is over the threshold.
- Fiber voltage is under the threshold.
- Fiber voltage is over the threshold.

Since a link is bidirectional, the event will be triggered when the traffic condition in either direction satisfies the configured severity threshold.

1. Navigate to **Menu** (☰) > **Topology**.

The **Topology** screen will appear and display the Topology Map by default.

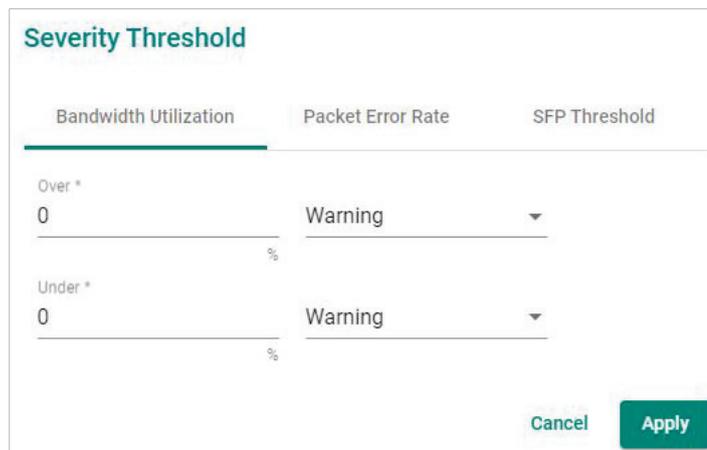

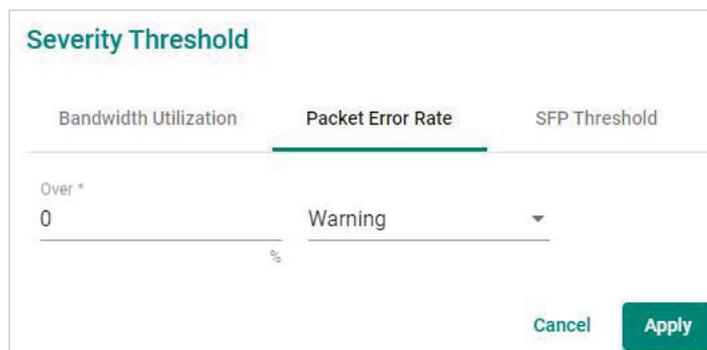

2. Click on a link between devices in the Topology Map.

The **Link Properties** pane and toolbar appear when a link is selected.

3. Click **Severity Threshold**.

The **Severity Threshold** screen will appear.

The 'Severity Threshold' configuration screen with 'Bandwidth Utilization' selected. It features three tabs: 'Bandwidth Utilization', 'Packet Error Rate', and 'SFP Threshold'. Under 'Bandwidth Utilization', there are two rows: 'Over *' with a value of '0' and a severity of 'Warning', and 'Under *' with a value of '0' and a severity of 'Warning'. Each row has a percentage sign below the value. 'Cancel' and 'Apply' buttons are at the bottom right.The 'Severity Threshold' configuration screen with 'Packet Error Rate' selected. It features three tabs: 'Bandwidth Utilization', 'Packet Error Rate', and 'SFP Threshold'. Under 'Packet Error Rate', there is one row: 'Over *' with a value of '0' and a severity of 'Warning'. There is a percentage sign below the value. 'Cancel' and 'Apply' buttons are at the bottom right.

Severity Threshold

Bandwidth Utilization Packet Error Rate **SFP Threshold**

SFP TX Under *	0	Warning	▼
0 ~ -100 dBm			
SFP RX Under *	0	Warning	▼
0 ~ -100 dBm			
SFP Voltage Under *	0	Warning	▼
0 ~ 10 V			
SFP Voltage Over *	0	Warning	▼
0 ~ 10 V			
SFP Temperature Over *	0	Warning	▼
0 ~ 200 °C			

Cancel Apply

4. To trigger an event when the bandwidth utilization on a link exceeds a specified percentage:
 - a. Click the **Bandwidth Utilization** tab.
 - b. In the **Over** field, specify the maximum bandwidth utilization percentage.
 - c. From the adjacent drop-down list, select one of the following severity levels:
 - Information
 - Warning
 - Critical
5. To trigger an event when the bandwidth utilization on a link falls below a specified percentage:
 - a. Click the **Bandwidth Utilization** tab.
 - b. In the **Under** field, specify the minimum bandwidth utilization percentage.
 - c. From the adjacent drop-down list, select one of the following severity levels:
 - Information
 - Warning
 - Critical
6. To trigger an event when the packet error rate exceeds a specified percentage:
 - a. Click the **Packet Error Rate** tab.
 - b. In the **Over** field, specify the maximum bandwidth utilization percentage.
 - c. From the adjacent drop-down list, select one of the following severity levels:
 - Information
 - Warning
 - Critical
7. To trigger an event when the SFP Tx falls below a specific range:
 - a. Click the **SFP Threshold** tab.
 - b. In the **SFP Tx Under** field, specify the maximum Tx threshold in dB (0~-100)
 - c. From the adjacent drop-down list, select one of the following severity levels:
 - Information
 - Warning
 - Critical

8. To trigger an event when the SFP Rx falls below a specific range:
 - a. Click the **SFP Threshold** tab.
 - b. In the **SFP Rx Under** field, specify the maximum Rx threshold in dB (0~100)
 - c. From the adjacent drop-down list, select one of the following severity levels:
 - Information
 - Warning
 - Critical
9. To trigger an event when the SFP voltage falls below a specific range:
 - a. Click the **SFP Threshold** tab.
 - b. In the **SFP Voltage Under** field, specify the maximum voltage in V (0~10)
 - c. From the adjacent drop-down list, select one of the following severity levels:
 - Information
 - Warning
 - Critical
10. To trigger an event when the SFP voltage exceeds a specific range:
 - a. Click the **SFP Threshold** tab.
 - b. In the **SFP Voltage Over** field, specify the minimum voltage in V (0~10)
 - c. From the adjacent drop-down list, select one of the following severity levels:
 - Information
 - Warning
 - Critical
11. To trigger an event when the SFP temperature exceeds a specific range:
 - a. Click the **SFP Threshold** tab.
 - b. In the **SFP Temperature Over** field, specify the minimum temperature in Celsius (0~100)
 - c. From the adjacent drop-down list, select one of the following severity levels:
 - Information
 - Warning
 - Critical
12. Click **Apply**.

MXview One will update the modified settings.
13. (Optional) Configure the Severity Threshold and Fiber status:
 - a. Navigate to **Menu** (☰) > **Administration** > **Global Device Settings**.

The **Global Device Settings** screen appears.
 - b. To set the threshold, you can go to the sections below to complete the settings.
 - Bandwidth Utilization
 - Packet Error Rate
 - SFP Threshold
 - c. Click **Save**.

MXview updates the web console protocol settings.

NOTE

If you complete the Bandwidth Utilization, Packet Error Rate, and SFP Threshold settings in the Global Device Settings section, the settings will be implemented to all the devices in your topology.

Configuring Custom Port Labels

MXview One uses the following port labelling convention to identify directions of traffic on a link.

<Device IP Address> / <Port Number>

You can use the Set Port Label screen to customize the port labels.

1. Navigate to **Menu** (☰) > **Topology**.

The **Topology** screen will appear and display the Topology Map by default.

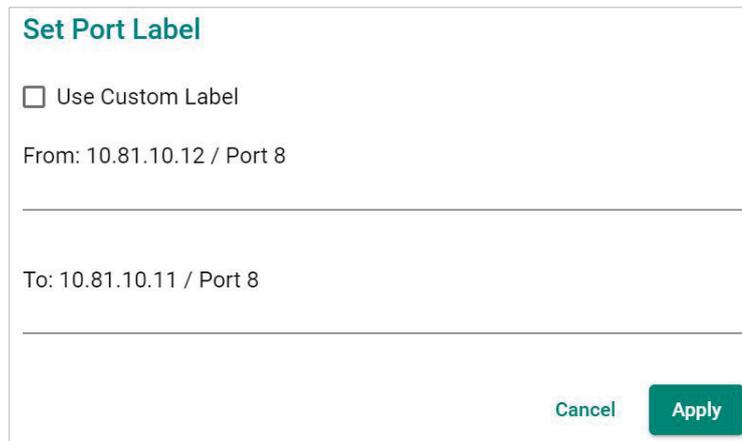

2. Click on a link between devices in the Topology Map.

The **Link Properties** pane and toolbar appear when a link is selected.

3. Click **Set Port Label**.

The **Set Port Label** screen appears.

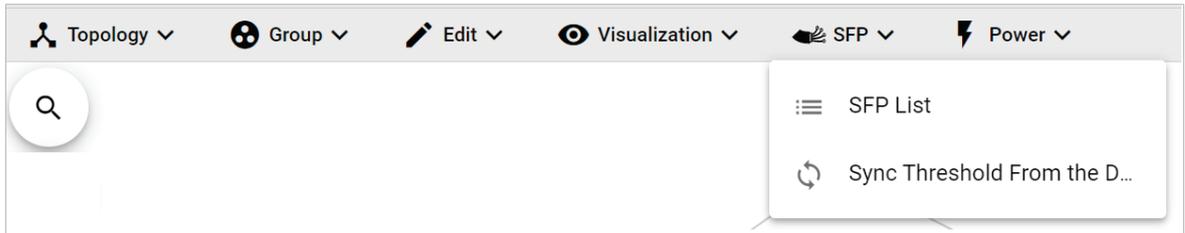

A screenshot of the 'Set Port Label' configuration window. At the top left is the title 'Set Port Label'. Below it is a checkbox labeled 'Use Custom Label'. Underneath, there are two text input fields. The first is labeled 'From:' and contains the text '10.81.10.12 / Port 8'. The second is labeled 'To:' and contains the text '10.81.10.11 / Port 8'. At the bottom right of the window are two buttons: 'Cancel' and 'Apply'.

4. Select the **Use Custom Label** check box.
5. In the **From** field, provide a new label for the source port.
6. In the **To** field, provide a new label for the destination port.
7. Click **Apply**.

9. SFP Fiber Status

Viewing the SFP Fiber Status in Table View

MXview One collects and display fiber status in **SFP > SFP List**

The list shows Fiber TX, RX, temperature, and voltage of the cables that are connected.

SFP List

Refresh icon: 

Search:

	TX (dBm)	RX (dBm)	Temp. (°C)	Volt. (V)		TX (dBm)	RX (dBm)	Temp. (°C)	Volt. (V)
10.81.10.12 Port 8 / SFP-1GSXLC	-6.1	-6.3	42.1	3.3	10.81.10.11 Port 8 / SFP-1GSXLC	-6	-5.9	43	3.3
10.81.10.10 Port 8 / SFP-1GSXLC	-6.3	-5.8	41.6	3.3	10.81.10.11 Port 9 / SFP-1GSXLC	-6.2	-6.1	44.2	3.3
10.81.10.12 Port 9 / SFP-1GSXLC	-6	-5.9	43.7	3.3	10.81.10.13 Port 8 / SFP-1GSXLC	-6.1	-6.2	40.7	3.4

Synchronize the SFP Threshold From the Device

MXview One can synchronize the threshold from devices, which can detect Moxa's SFP connector to get the specific threshold.

Navigate to **SFP > Sync Threshold From the Device**

Click **Sync** and the threshold from the devices will sync to the SFP Threshold of every link.

Sync the SFP Threshold From the Device

You can sync the SFP Threshold from Moxa's switch. After syncing, the Temperature, Tx Power, and Rx Power of Fiber Check will be synced to the SFP Threshold of every link.

*To check the SFP Threshold, you can click on a link, then choose Severity Threshold → SFP Threshold.

Bandwidth Utilization	Packet Error Rate	SFP Threshold
SFP TX Under *		
0	Warning	
0 ~ 100	dB	
SFP RX Under *		
0	Warning	
0 ~ 100	dB	
SFP Voltage Under *		
0	Warning	
0 ~ 10	dB	
SFP Voltage Over *		
0	Warning	
0 ~ 10	V	
SFP Temperature Over *		
0	Warning	
0 ~ 100	°C	

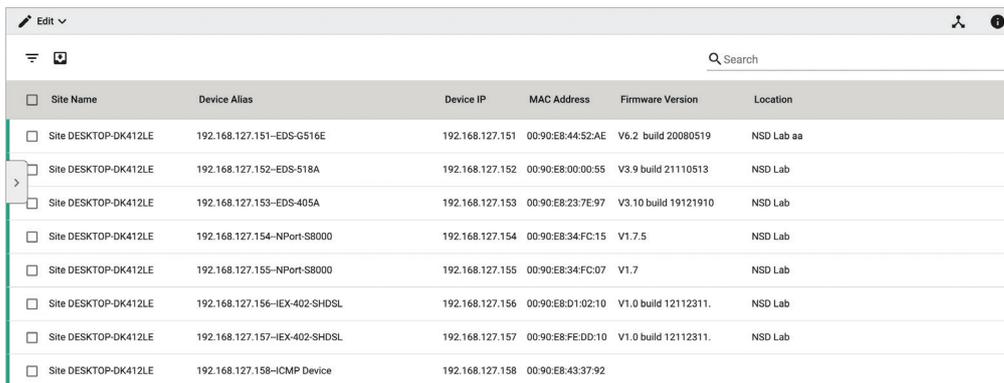

Are you sure you want to sync the SFP threshold from the device?

10. Device Management

The MXview One **Topology** screen provides several features and tools for managing and maintaining devices in your network topology.

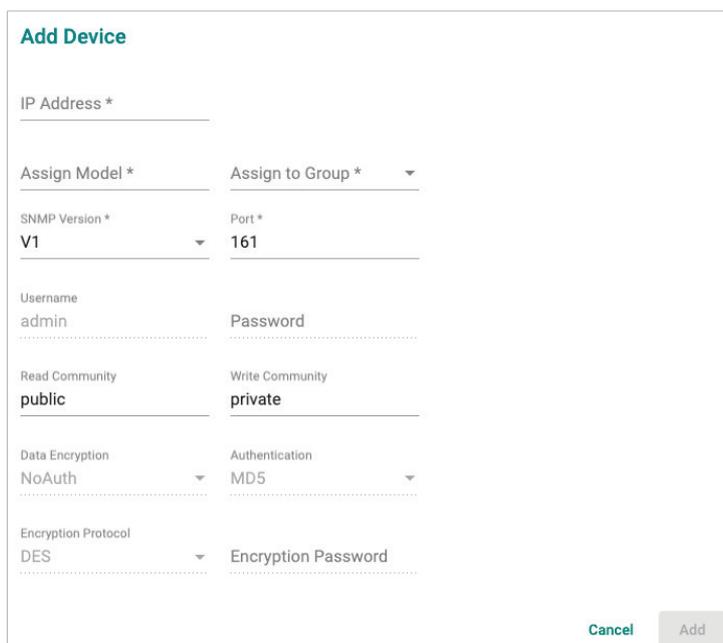

Viewing the Device List

The **List view** on the **Topology** screen will display a list of discovered devices in your network topology. You can also use this view to manually add devices to your network topology or export filtered data as a CSV file.

Site Name	Device Alias	Device IP	MAC Address	Firmware Version	Location

1. Navigate to **Menu** (☰) > **Topology**.
The **Topology** screen will appear and display the Topology Map in Topology view.
2. Click the **List view** (☰) icon in the top right corner.
The **Topology** screen displays a list of devices on your network.
3. To add a device to your network topology:
 - a. Click **Edit > Add Device**.
The **Add Device** screen will appear.

Add Device

Cancel Add

- b. Configure the following:
 - IP Address:** Specify the IP address of the device
 - Assign Model:** Select the model of the device
 - Assign To Group:** Select the group to assign the device to
 - SNMP Version:** Select the SNMP version
 - Username:** Specify the device login Username
 - Password:** Create a password
 - Read Community:** Specify the SNMP read community string
 - Write Community:** Specify the SNMP write community string
 - Data Encryption:** Select the data encryption method
 - Authentication:** Select the authentication method
 - Encryption Key:** Specify the encryption key
- c. Click **Add**.
MXview One adds the device to the topology.
4. To delete devices in your network topology:
 - a. Check the box on the first column of devices.
 - b. Click the **Delete** (🗑️) icon on the menu bar. The **Delete Device** screen appears.
 - c. For non AWK devices, read the message and then click **Delete** if you are sure you want to delete the device.

Delete Device

Are you sure you want to delete this device?

- d. For AWK devices, read the message and wait for the countdown. Click **Delete** if you are sure you want to delete the device.

Delete Device

⚠️ Confirmation of device(s) deletion

Historical data of deleted wireless client device(s) will also be purged and affect traceability of listed features. Do you want to proceed?

- Wireless Roaming Playback
- Device Dashboard

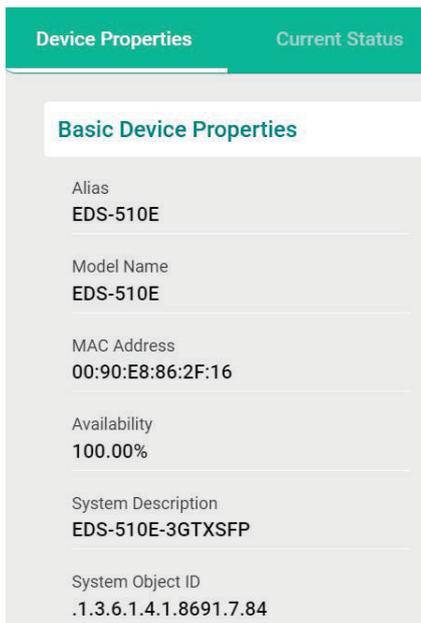

Delete (2)

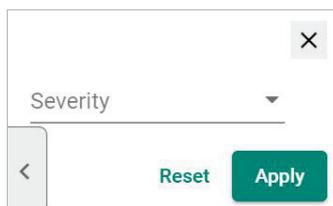

NOTE

If you click the check box for all the devices, when you click the Delete icon, you will delete all the devices in the topology.

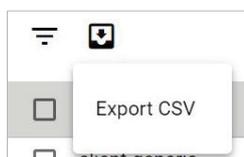

5. To view device properties, select the check box next to the **Site Name**.
The **Device Properties** details pane will appear.

6. To filter the device list by severity level:
 - a. Click the **Filter** (☰) icon in the top left corner.
The **Severity** drop-down list appears.

- b. Select one of the following severity levels:
 - Critical**
 - Warning**
 - Information**
 - c. Click **Apply**.
MXview One filters the device list to only display devices with the selected severity level.
 7. To export the device list:
 - a. Click the **Export** (📄) icon.

- b. Select **Export CSV**.
MXview One will export the displayed data as a CSV file.

Importing Device Configurations

Use the **Topology** screen to import an INI-formatted configuration file to a device in your network topology by selecting the device from the **Topology Map** or **Device List**.

1. Navigate to **Menu** (☰) > **Topology**.
The **Topology** screen will appear and displays the Topology Map by default.
2. Select one of the following views:
 - **Topology view:** Displays a graphical representation of devices in your network topology.
 - **List view:** Displays a list of the devices in your network topology.
3. Select the device that you want to import configurations to:
 - **Topology view:** Click the icon of the device in the Topology Map.
 - **List view:** Select the check box next to the site name in the Device List.

The toolbar options change.

4. Navigate to **Maintenance** > **Import Config**.
The **Import Config** screen appears and indicates the IP address of the selected device.

Import Config - 192.168.127.252

Import Config * 

The maximum file size is 1 MB.

* Please make sure the username and password for this device are correctly set in "Advanced Settings"

[Cancel](#) [Import](#)

5. Click the folder (📁) icon to upload the configuration file from your local machine.
6. Click **Import**.
MXview One imports the configuration file to the specified device.

Exporting Device Configurations

Use the **Topology** screen to export an INI-formatted configuration file from a device in your network topology by selecting the device from the **Topology Map** or **Device List**.

1. Navigate to **Menu** (☰) > **Topology**.

The **Topology** screen will appear and display the Topology Map by default.

2. Select one of the following views:

- **Topology view:** Displays a graphical representation of the devices in your network topology.
- **List view:** Displays a list of the devices in your network topology.

3. Select the device that you want to export configurations from.

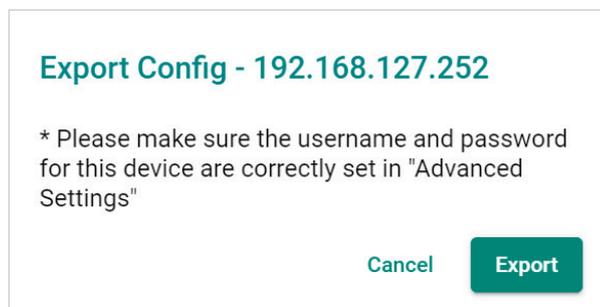

- **Topology view:** Click the icon of the device in the Topology Map.
- **List view:** Select the check box next to the device in the Device List.

The toolbar options change.

4. Navigate to **Maintenance** > **Export Config**.

The **Export Config** screen will appear and indicate the IP address of the selected device.

5. Click **Export**.

MXview One exports the device configurations as an INI file in the specified location.

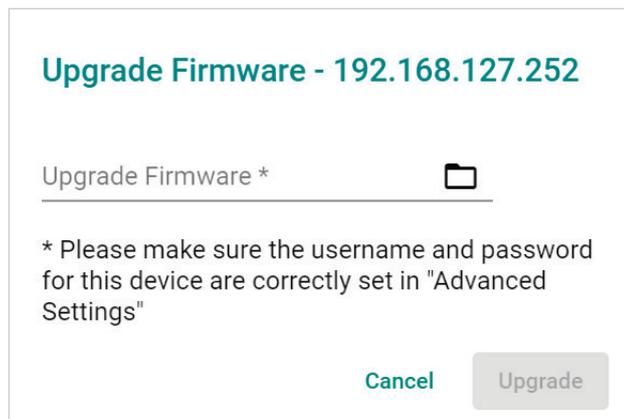

Upgrading Firmware

Use the **Topology** screen to upgrade the firmware (ROM-formatted file) on a device in your network topology by selecting the device from the **Topology Map** or **Device List**.

1. Navigate to **Menu** (☰) > **Topology**.
The **Topology** screen appears and displays the Topology Map by default.
2. Select one of the following views:
 - a. **Topology view:** Displays a graphical representation of the devices in your network topology.
 - b. **List view:** Displays a list of the devices in your network topology.
3. Select the device that you want to upgrade the firmware for:
 - a. **Topology view:** Click the icon of the device in the Topology Map.
 - b. **List view:** Select the check box next to the device in the Device List.The toolbar options change.

4. Navigate to **Maintenance** > **Upgrade Firmware**.
The Upgrade Firmware screen appears and indicates the IP address of the selected device.

5. Click the folder (📁) icon to upload the ROM-formatted firmware file from your local machine.
6. Click **Upgrade**.
MXview One will upgrade the firmware on the specified device.

Configuring SNMP Trap Server

MXview One can collaborate with other network management software and send SNMP Traps to non-Moxa NMS. MXview One supports up to two trap servers depending on the device.

1. Navigate to **Menu** (☰) > **Topology**.

The **Topology** screen will appear and display the Topology Map by default.

2. Select one of the following views:

- **Topology view:** Displays a graphical representation of the devices in your network topology.
- **List view:** Displays a list of the devices in your network topology.

3. Select the device.

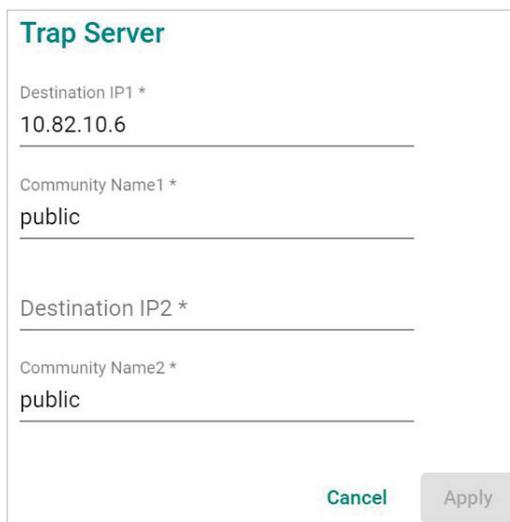

- **Topology view:** Click the icon of the device in the Topology Map.
- **List view:** Select the check box next to the device in the Device List.

The toolbar options change.

4. Navigate to **Maintenance** > **Trap Server**.

The **Trap Server** screen appears.

A form titled 'Trap Server' with four input fields. The first field is 'Destination IP1 *' with the value '10.82.10.6'. The second field is 'Community Name1 *' with the value 'public'. The third field is 'Destination IP2 *' which is empty. The fourth field is 'Community Name2 *' with the value 'public'. At the bottom right are 'Cancel' and 'Apply' buttons.

5. Configure the following SNMP trap server settings for the device:

- **Destination IP1**
- **Community Name1**
- (Optional) **Destination IP2**
- (Optional) **Community Name2**

6. Click **Apply**.

MXview One sends SNMP traps to the configured trap server(s) when events are detected on the device.

NOTE

When a device fails to reply within seven seconds, MXview One will display the message "Failed to update device Trap server settings." Please confirm the execution results via the same settings page or go to the web page of the devices.

Configuring Port Settings

Use the **Topology** screen to configure port settings for a device in your network topology by selecting the device from the **Topology Map** or **Device List**.

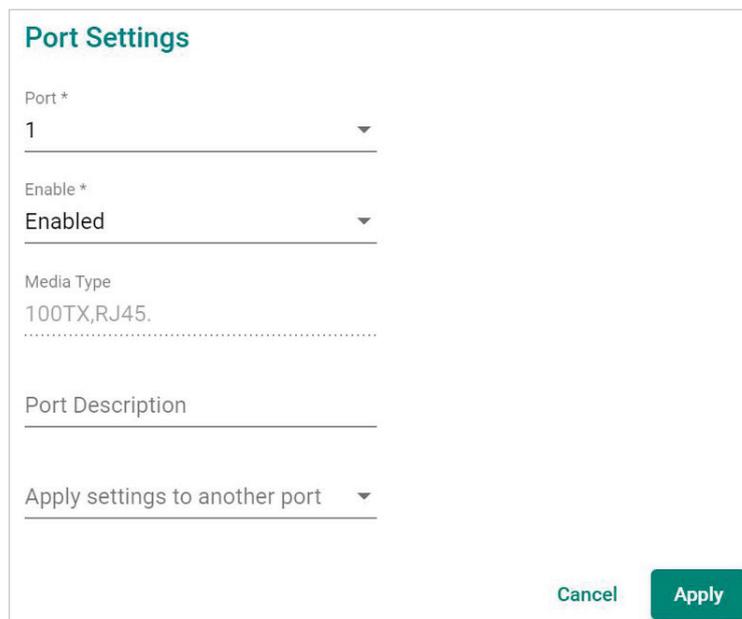

1. Navigate to **Menu** (☰) > **Topology**.
The **Topology** screen appears and displays the Topology Map by default.
2. Select one of the following views:
 - **Topology view:** Displays a graphical representation of the devices in your network topology.
 - **List view:** Displays a list of the devices in your network topology.
3. Select the device.
 - **Topology view:** Click the icon of the device in the Topology Map.
 - **List view:** Select the check box next to the device in the Device List.

The toolbar options will change.

4. Navigate to **Maintenance** > **Port Settings**.

The **Port Setting** screen appears.

A screenshot of the 'Port Settings' configuration window. It has a title bar 'Port Settings' in teal. Below the title are several fields: 'Port *' with a dropdown menu showing '1'; 'Enable *' with a dropdown menu showing 'Enabled'; 'Media Type' with a text field containing '100TX,RJ45.' and a dotted line below it; 'Port Description' with an empty text field; and 'Apply settings to another port' with a dropdown menu. At the bottom right, there are two buttons: 'Cancel' and 'Apply'.

5. Configure the following port settings for the device:
 - **Port:** Select the port number.
 - **Enable:** Enable or disable the port.
 - **Port Description:** Provide a description of the port.
 - **Apply settings to another port:** Select to apply the configured settings to other ports on the device.
6. Click **Apply**.
MXview One will update the port settings to the device.

Configuring SNMP Configuration

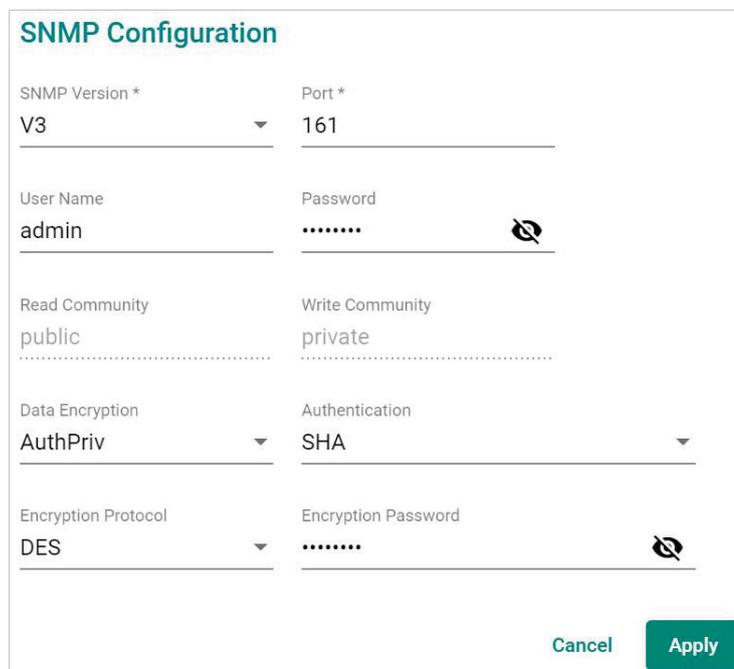

Use the **Topology** screen to configure SNMP settings for a device in your network topology by selecting the device from the **Topology Map** or **Device List**.

1. Navigate to **Menu** (☰) > **Topology**.
The **Topology** screen appears and displays the Topology Map by default.
2. Select one of the following views:
 - **Topology view:** Displays a graphical representation of the devices in your network topology.
 - **List view:** Displays a list of the devices in your network topology.
3. Select the device.
 - **Topology view:** Click the icon of the device in the Topology Map.
 - **List view:** Select the check box next to the device in the Device List.

The toolbar options will change.

4. Navigate to **Maintenance** > **SNMP Configuration**.
The **SNMP Configuration** screen will appear.

A screenshot of the 'SNMP Configuration' form. The title 'SNMP Configuration' is at the top left. The form has two columns of fields. The first column contains: 'SNMP Version *' (dropdown menu with 'V3' selected), 'User Name' (text input with 'admin'), 'Read Community' (text input with 'public'), 'Data Encryption' (dropdown menu with 'AuthPriv' selected), and 'Encryption Protocol' (dropdown menu with 'DES' selected). The second column contains: 'Port *' (text input with '161'), 'Password' (password input with dots and an eye icon), 'Write Community' (text input with 'private'), 'Authentication' (dropdown menu with 'SHA' selected), and 'Encryption Password' (password input with dots and an eye icon). At the bottom right, there are two buttons: 'Cancel' and 'Apply'.

5. Configure the following SNMP settings for the device:
 - **SNMP Version**
 - **SNMP Port**
 - **Username**
 - **Password**
 - **Read Community**
 - **Write Community**
 - **Data Encryption**
 - **Authentication**
 - **Encryption Protocol**
 - **Encryption Password**
6. Click **Apply**.
MXview One updates the SNMP configuration settings to the device.

NOTE

For the first time, users can use the Device Settings Template function to set the function template. For more information, see **Changing Default SNMP Configuration**.

Configuring Polling Settings

Use the **Topology** screen to configure ICMP or SNMP polling settings for a device in your network topology by selecting the device from the **Topology Map** or **Device List**.

1. Navigate to **Menu** (☰) > **Topology**.
The **Topology** screen will appear and display the Topology Map by default.
2. Select one of the following views:
 - **Topology view:** Displays a graphical representation of the devices in your network topology.
 - **List view:** Displays a list of the devices in your network topology.
3. Select the device.
 - **Topology view:** Click the icon of the device in the Topology Map.
 - **List view:** Select the check box next to the device in the Device List.

The toolbar options change.

4. Navigate to **Maintenance** > **Polling Settings**.

The **Polling Settings** screen appears.

Polling Settings

ICMP Polling Interval *
10
10 - 600 sec

SNMP Polling Interval *
60
60 - 600 sec

Cancel Apply

5. Configure the following polling settings for the device:
 - **ICMP polling interval**
 - **SNMP polling interval**
6. Click **Apply**.
MXview One will update the polling settings for the device.

NOTE

For the first time, users can use the Device Settings Template function to set the function template. For more information, see **Configuring Device Polling Settings**.

Configuring Advanced Settings

Use the **Topology** screen to configure advanced settings for a device in your network topology by selecting the device from the **Topology Map** or **Device List**.

1. Navigate to **Menu** (☰) > **Topology**.

The **Topology** screen will appear and display the Topology Map by default.

2. Select one of the following views:

- **Topology view:** Displays a graphical representation of the devices in your network topology.
- **List view:** Displays a list of the devices in your network topology.

3. Select the device.

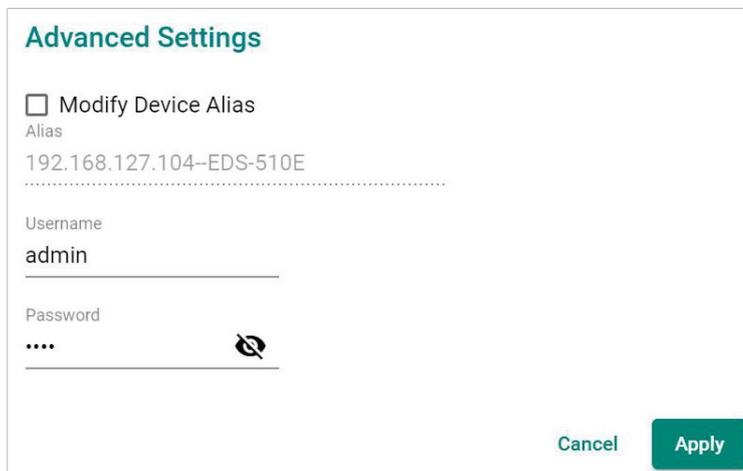

- **Topology view:** Click the icon of the device in the Topology Map.
- **List view:** Select the check box next to the device in the Device List.

The toolbar options change.

4. Navigate to **Maintenance** > **Advanced Settings**.

The **Advanced Settings** screen appears.

A dialog box titled 'Advanced Settings' with a teal header. It contains a checkbox labeled 'Modify Device Alias'. Below it is an 'Alias' field with the text '192.168.127.104-EDS-510E'. There are 'Username' and 'Password' fields. The 'Username' field contains 'admin'. The 'Password' field contains four dots and a toggle icon. At the bottom right are 'Cancel' and 'Apply' buttons.

5. To modify device alias:
 - a. Select the **Modify Device Alias** check box.
 - b. Edit the **Alias** field.
6. To specify login credentials for the device web console
Enter the **Username** and **Password** for the device web console.
7. Click **Apply**.
MXview One updates the advanced settings.

Changing the Device Icon

Use the **Topology** screen to change the device icon by selecting the device from the **Topology Map** or **Device List**, and then upload a JPG, GIF, or PNG image file.

1. Navigate to **Menu** (☰) > **Topology**.
The **Topology** screen will appear and display the Topology Map by default.
2. Select one of the following views:
 - **Topology view:** Displays a graphical representation of the devices in your network topology.
 - **List view:** Displays a list of the devices in your network topology.
3. Select the device.
 - **Topology view:** Click the icon of the device in the Topology Map.
 - **List view:** Select the check box next to the device in the Device List.The toolbar options will change.

4. Navigate to **Maintenance** > **Change Device Icon**.
The **Change Device Icon** screen appears.

5. Click the folder (📁) icon to upload the device icon from your local machine. (The maximum image size is 100 kB.)
6. Click **Apply**.
MXview One will change the device icon to the uploaded JPG, GIF, or PNG image file.

Signing on to Device Web Consoles

MXview One allows you to use the **Topology** screen to the web console for a device from the **Topology Map** or **Device List**.

NOTE

You can use the **Global Device Settings** screen to configure the web console protocol. The web console protocol can be set to HTTP or HTTPS, and then the port numbers of the HTTP and HTTPS can be set by users.

1. (Optional) Configure the web console protocol:
 - a. Navigate to **Menu** (☰) > **Administration** > **Global Device Settings**.
The **Global Device Settings** screen appears.
 - b. Find the **Management Interface** to complete the settings.

Management Interface

Web Console Protocol
HTTP

HTTP Port *
80

HTTPS Port *
443

Save

- c. Configure the following:
 - Web Console Protocol**
 - HTTP Port**
 - HTTPS Port**
- d. Click **Save**.
MXview One updates the web console protocol settings.

NOTE

If you complete the Management Interface settings in the Global Device Settings section, the settings will be applied to all the devices in your topology.

2. Navigate to **Menu** (☰) > **Topology**.
The **Topology** screen will appear and display the Topology Map by default.
3. Select one of the following views:
 - **Topology view:** Displays a graphical representation of the devices in your network topology.
 - **List view:** Displays a list of the devices in your network topology.
4. Select the device.
 - **Topology view:** Click the icon of the device in the Topology Map.
 - **List view:** Select the check box next to the device in the Device List.The toolbar options change.

5. Navigate to **Tools** > **Web Console**.
The login screen for device web console appears in a new browser tab.

NOTE

You may need to allow pop-ups on your web browser in order to view the device web console.

6. Enter the **Username** and **Password** for the device web console.
7. Click **Login**.
The device web console will successfully log in.

Changing Device Groups

Use the **Topology** screen to change the assigned group for a device by selecting the device from the **Topology Map** or **Device List**.

1. Navigate to **Menu** (☰) > **Topology**.
The **Topology** screen will appear and display the Topology Map by default.
2. Select one of the following views:
 - > **Topology view**: Displays a graphical representation of the devices in your network topology.
 - > **List view**: Displays a list of the devices in your network topology.
3. Select the device.
 - > **Topology view**: Click the icon of the device in the Topology Map.
 - > **List view**: Select the check box next to the device in the Device List.

The toolbar options change.

4. Click **Change Group**.
The **Change Group** screen will appear and displays the following information:

The image shows a 'Change Group' dialog box. At the top, it says 'Change Group' in a teal font. Below that, there is a dropdown menu labeled 'Current Group *' with 'Root' selected. Underneath is a list of IP addresses, each with a checkbox. The IP address 10.81.10.11 has a checked checkbox. Below the list, it says '1 Selected / 30 total'. At the bottom, there is another dropdown menu labeled 'Assign to Group *'. At the very bottom, there are two buttons: 'Cancel' and 'Apply'.

5. (Optional) Select additional IP addresses to assign other devices from the current group to the new group.

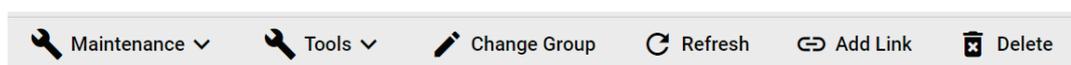

6. From the **Assign to Group** drop-down list, select the new group that you want to assign the selected device(s) to.
7. Click **Apply**.
MXview One will assign the selected device(s) to the new group.

Refreshing the Device Status

Since some device data is collected by polling, there may be a time delay for some data. Use the **Topology** screen to refresh the device status by selecting the device from the **Topology Map** or **Device List**.

1. Navigate to **Menu** (☰) > **Topology**.
The **Topology** screen appears and displays the Topology Map by default.
2. Select one of the following views:
 - **Topology view:** Displays a graphical representation of the devices in your network topology.
 - **List view:** Displays a list of the devices in your network topology.
3. Select the device.
 - **Topology view:** Click the icon of the device in the Topology Map.
 - **List view:** Select the check box next to the device in the Device List.

The toolbar options change.

4. Click **Refresh**.
MXview One polls the device for updated data.

Deleting Devices

Use the **Topology** screen to delete devices from the Topology Map. After a device is deleted, it will be removed from the topology map and the device will not be polled.

1. Navigate to **Menu** (☰) > **Topology**.
The **Topology** screen appears and displays the Topology Map by default.
2. Select one of the following views:
 - **Topology view:** Displays a graphical representation of the devices in your network topology.
 - **List view:** Displays a list of the devices in your network topology.
3. Select the device.
 - **Topology view:** Click the icon of the device in the Topology Map.
 - **List view:** Select the check box next to the device in the Device List.

The toolbar options will change.

4. Click **Delete**.
MXview One removes the device from your network topology.

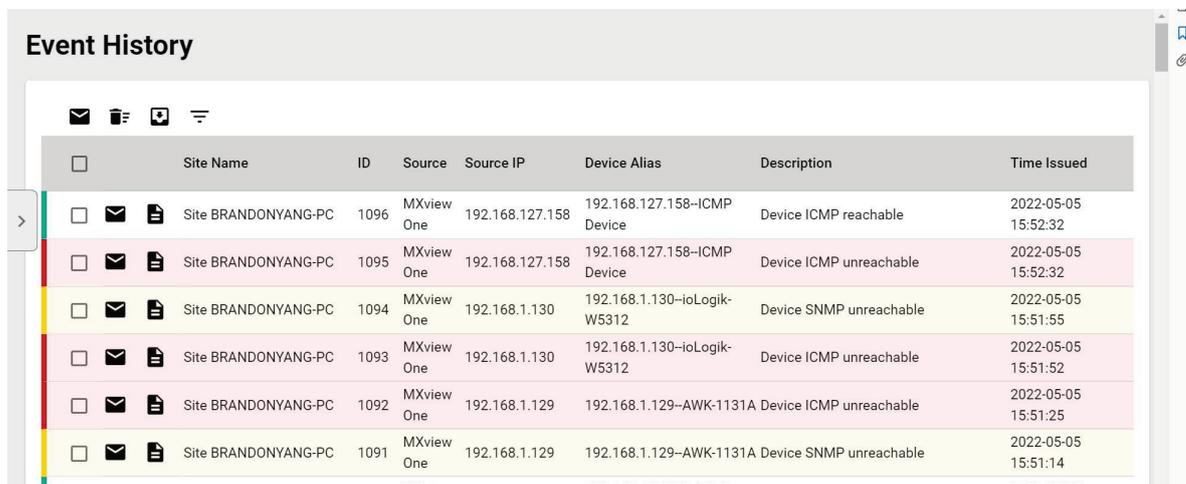

11. Events and Notifications

MXview One allows you to monitor system events, create custom monitoring events, and configure event notifications.

Event Monitoring

Viewing Event History

The **Event History** screen provides information about all the network events for devices in your topology. Use the filters to customize the information displayed in the table. You can also export the data as a CSV file.

	Site Name	ID	Source	Source IP	Device Alias	Description	Time Issued
<input type="checkbox"/>	Site BRANDONYANG-PC	1096	MXview One	192.168.127.158	192.168.127.158-ICMP Device	Device ICMP reachable	2022-05-05 15:52:32
<input type="checkbox"/>	Site BRANDONYANG-PC	1095	MXview One	192.168.127.158	192.168.127.158-ICMP Device	Device ICMP unreachable	2022-05-05 15:52:32
<input type="checkbox"/>	Site BRANDONYANG-PC	1094	MXview One	192.168.1.130	192.168.1.130-ioLogik-W5312	Device SNMP unreachable	2022-05-05 15:51:55
<input type="checkbox"/>	Site BRANDONYANG-PC	1093	MXview One	192.168.1.130	192.168.1.130-ioLogik-W5312	Device ICMP unreachable	2022-05-05 15:51:52
<input type="checkbox"/>	Site BRANDONYANG-PC	1092	MXview One	192.168.1.129	192.168.1.129-AWK-1131A	Device ICMP unreachable	2022-05-05 15:51:25

1. Navigate to **Menu** (☰) > **Event Management** > **Event History**.

The **Event History** screen will display the following information in a table format:

Column	Description
Ack All Events/Acknowledge	Acknowledge status of the event
Show Details	The detailed information of this event
Site Name	The site to which the device that issued the event belongs
ID	The unique identifier of the event
Source IP	The IP address of the device that issued the event
Source	The source of the event
Device Alias	The unique name of the device
Description	The description of the event
Time Issued	The time the event was issued

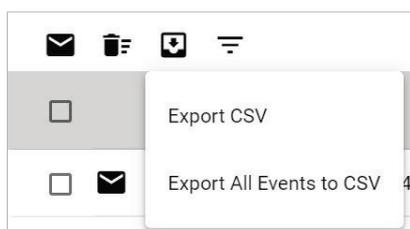

2. To filter the information in the table by specific criteria:
 - a. Click the **Filter** (☰) icon in the top left corner.
The following screen will appear.

- b. Specify any of the following criteria:

Criteria	Description
Severity	Select the severity level of the event
Site Name	Select the site to which the device that issued the event belongs
Group	Select the group to which the device is assigned
IP Address	Specify the IP address of the device
Source	Select the source of the event
Acknowledge	Select the acknowledgement status of the event
Start Date	Specify the start date and time for the event data to display
End Date	Specify the end date and time for the event data to display

- c. Click **Apply**.
MXview One filters the table to only display events that match the specified criteria.
3. To sort the data in the table by a specific column, click the column heading.
MXview One sorts the table by the column.
4. To export data displayed on the **Event History** screen:

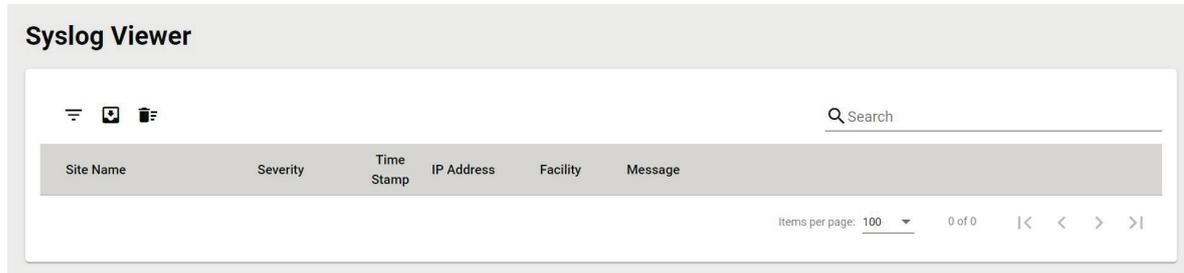

- a. Click the **Export** (📄) icon.

- b. Select **Export CSV** for just the events on the first page or **Export All Events to CSV** for all event pages.
MXview One exports the displayed event data as a CSV file.

Viewing Syslog Events

The **Syslog Viewer** screen provides information about the syslog events on your network. Use the filters to customize the information displayed in the table. You can also export the data as a CSV file.

1. Enable the built-in syslog server.
 - a. Navigate to **Menu** (☰) > **Administration** > **System Settings**.
The **System Settings** screen appears.
 - b. Find the **Syslog Server Configuration** section.
The **Syslog Server Configuration** settings will appear.

- c. Select **Enabled** from the Enable built-in syslog server drop-down list.
 - d. Specify the syslog server communication port.
 - e. Click **Save**.
MXview One enables the built-in syslog server and starts logging syslog events.
2. Navigate to **Menu** (☰) > **Event Management** > **Syslog Viewer**.
The **Syslog Viewer** screen displays the following information in a table format:

Column	Description
Site Name	The site to which the device that issued the event belongs
Severity	The severity of the event
Time Stamp	The time the event was issued
IP Address	The IP address of the device that issued the event
Facility	The group the device is assigned to
Message	The description of the event

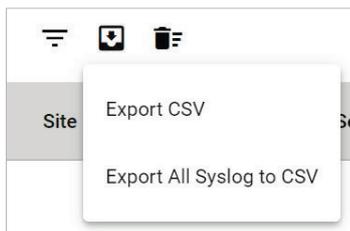

3. To search the information in the table, type a full or partial string that matches the value in any of the table columns.
MXview One searches the table to only display results that fully or partially match the specified string.

4. To filter the information in the table by specific criteria:
 - a. Click the **Filter** (☰) icon in the top left corner.
The following screen will appear.

- b. Specify any of the following criteria:

Criteria	Description
Site Name	Select the site to which the device that issued the event belongs
IP Address	Specify the IP address of the device that issued the event
Facility	Select the group to which the device is assigned
Priority	Select the criteria operator for matching the event severity level: <ul style="list-style-type: none"> • Higher than or equal to • Equals • Lower than or equal to
Severity	Select the severity level of the event
Start Date	Specify the start date and time for the event data to display
End Date	Specify the end date and time for the event data to display

- c. Click **Apply**.
MXview One filters the table to only display events that match the specified criteria.
5. To sort the data in the table by a specific column, click the column heading.
MXview One sorts the table by the column.
6. To export data displayed on the **Syslog Viewer** screen:
 - a. Click the **Export** (📄) icon.

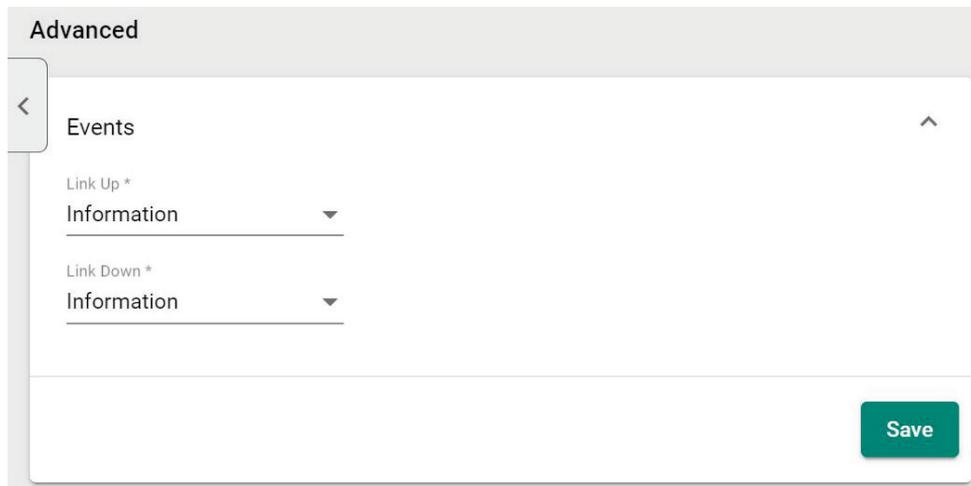

- b. Select **Export CSV** for just the first syslog page or **Export All Syslog to CSV** for all syslog pages.
MXview One exports the displayed syslog data as a CSV file.

Configuring Event Thresholds and Severity Levels

Use the **Preferences** and **Global Device Settings** screen to configure default event thresholds and severity levels.

1. Navigate to **Menu** (☰) > **Administration** > **Preferences**.
The **Preferences** screen will appear.
2. In the **Advanced** section, expand **Events**.
The **Events** settings will appear.

The screenshot shows a mobile application interface for configuring event settings. At the top, there is a header labeled 'Advanced'. Below it, a section titled 'Events' is expanded. Under 'Events', there are two dropdown menus: 'Link Up *' and 'Link Down *'. Both dropdown menus currently show 'Information' as the selected option. At the bottom right of the 'Events' section, there is a green 'Save' button.

3. Select one of the following severity levels for **Link Up** events:
 - > **Information**
 - > **Waning**
 - > **Critical**
4. Select one of the following severity levels for **Link Down** events:
 - > **Information**
 - > **Warning**
 - > **Critical**
5. Navigate to **Menu** (☰) > **Administration** > **Global Device Settings**.
The **Global Device Settings** screen will appear.

NOTE

Once you save the settings in the Global Device Settings section, the settings will synchronize to each device in the topology.

6. To trigger events when network bandwidth utilization exceeds a threshold:
 - a. Select **Enabled** from the first **Bandwidth Utilization Over** drop-down list.

The screenshot shows a configuration screen for 'Bandwidth Utilization Over'. The first dropdown menu, labeled 'Bandwidth Utilization Over', is highlighted with a red box and shows 'Enabled' selected. Below it, there is a numerical input field for the threshold, currently set to '0', followed by a '%' symbol. To the right of the threshold field is a 'Severity' dropdown menu set to 'Warning'.

- b. Specify the percentage of bandwidth utilization for the threshold.

Bandwidth Utilization Over
Enabled

Bandwidth Utilization Over
0 %

Severity
Warning

- c. Select the **Severity** level for the event.
7. To trigger events when network bandwidth utilization falls below a threshold:
- a. Select **Enabled** from the first **Bandwidth Utilization Under** drop-down list.

Bandwidth Utilization Under
Enabled

Bandwidth Utilization Under
0 %

Severity
Warning

- b. Specify the percentage of bandwidth utilization for the threshold.

Bandwidth Utilization Under
Enabled

Bandwidth Utilization Under
0 %

Severity
Warning

- c. Select the **Severity** level for the event.
8. To trigger events when the packet error rate exceeds a threshold:
- a. Select **Enabled** from the first **Packet Error Rate Over** drop-down list.

Packet Error Rate Over
Enabled

Packet Error Rate Over
0 %

Severity
Warning

- b. Specify the packet error rate for the threshold.

Packet Error Rate Over
Enabled

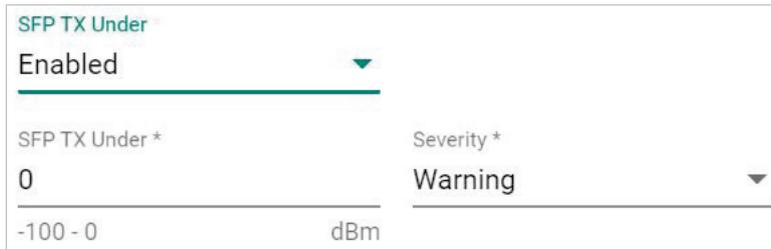

Packet Error Rate Over
0 %

Severity
Warning

- c. Select the **Severity** level for the event.

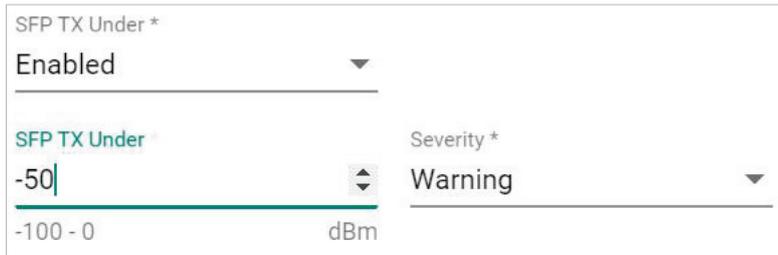

9. To trigger events when the SFP TX value is below a certain threshold:

a. Select **Enabled** from the first **SFP TX Under** drop-down list.

The screenshot shows a configuration form for 'SFP TX Under'. The first dropdown menu is set to 'Enabled'. Below it, the 'SFP TX Under *' field has a value of '0' and a range of '-100 - 0' with the unit 'dBm'. To the right, the 'Severity *' dropdown menu is set to 'Warning'.

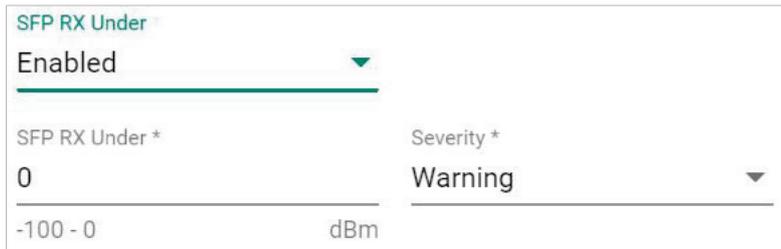

b. Specify the SFP TX threshold level.

The screenshot shows the same configuration form as above, but the 'SFP TX Under *' field now has a value of '-50' and a range of '-100 - 0' with the unit 'dBm'. The 'Severity *' dropdown menu remains set to 'Warning'.

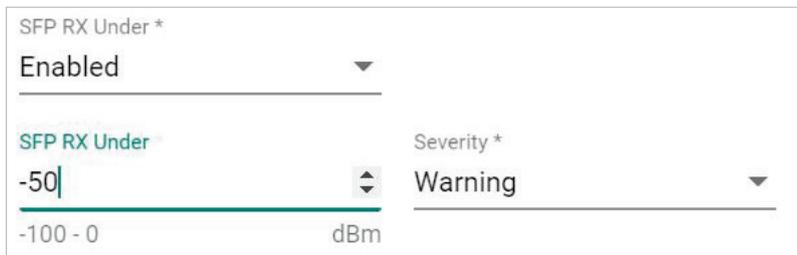

10. To trigger events when the SFP RX value is below a certain threshold:

a. Select **Enabled** from the first **SFP RX Under** drop-down list.

The screenshot shows a configuration form for 'SFP RX Under'. The first dropdown menu is set to 'Enabled'. Below it, the 'SFP RX Under *' field has a value of '0' and a range of '-100 - 0' with the unit 'dBm'. To the right, the 'Severity *' dropdown menu is set to 'Warning'.

b. Specify the SFP RX threshold level.

The screenshot shows the same configuration form as above, but the 'SFP RX Under *' field now has a value of '-50' and a range of '-100 - 0' with the unit 'dBm'. The 'Severity *' dropdown menu remains set to 'Warning'.

11. To trigger events when the SFP voltage is below a certain threshold:

a. Select **Enabled** from the first **SFP Voltage Under** drop-down list.

The screenshot shows a configuration form for 'SFP Voltage Under'. The first dropdown menu is set to 'Enabled'. Below it, the 'SFP Voltage Under *' field has a value of '0' and a range of '0 - 10' with the unit 'V'. To the right, the 'Severity *' dropdown menu is set to 'Warning'.

- b. Specify the SFP Voltage threshold level.

SFP Voltage Under *

Enabled

SFP Voltage Under

5

0 - 10 V

Severity *

Warning

12. To trigger events when the SFP voltage is over a certain threshold:

- a. Select **Enabled** from the first **SFP Voltage Over** drop-down list.

SFP Voltage Over *

Enabled

SFP Voltage Over *

0

0 - 10 V

Severity *

Warning

- b. Specify the SFP Voltage threshold level.

SFP Voltage Over *

Enabled

SFP Voltage Over *

5

0 - 10 V

Severity *

Warning

13. To trigger events when the SFP temperature is over a certain threshold:

- a. Select **Enabled** from the first **SFP Temperature Over** drop-down list.

SFP Temperature Over *

Enabled

SFP Temperature Over *

0

0 - 100 °C

Severity *

Warning

- b. Specify the SFP Temperature threshold level.

SFP Temperature Over *

Enabled

SFP Temperature Over *

50

0 - 100 °C

Severity *

Warning

NOTE

If the threshold is set as '0', the threshold function will be disabled.

14. Click **Save**.

MXview One will update the event threshold settings.

Notification Methods

MXview One supports email notifications for events. The notification method requires specific server configurations.

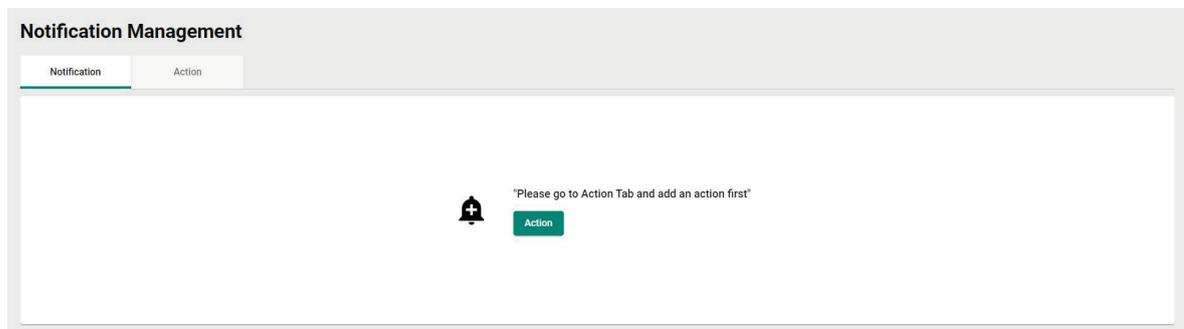

Configuring Email Server Settings

Use the **System Settings** screen to configure an email server to send email notifications for event notifications.

1. Navigate to **Menu** (☰) > **Administration** > **System Settings**.
The **System Settings** screen will appear.
2. Find the **Email Server Configuration** section.
3. Configure the following:
 - **Server Domain Name/IP**
 - **Port number**
 - **Encryption**
 - **Username**
 - **Password**
 - **Sender Address**
4. Click **Save**.
MXview One can send email messages for configured event notifications.

Notification Management

The **Notification Management** screen allows you to configure event notifications by issuing a registered action (e.g., sending an email message to a specified recipient) when configured events are detected on your network.

Configuring New Event Notifications

MXview One event notifications require at least one registered action (e.g., sending an email message to a specified recipient), which MXview One performs when a specified event is detected on your network.

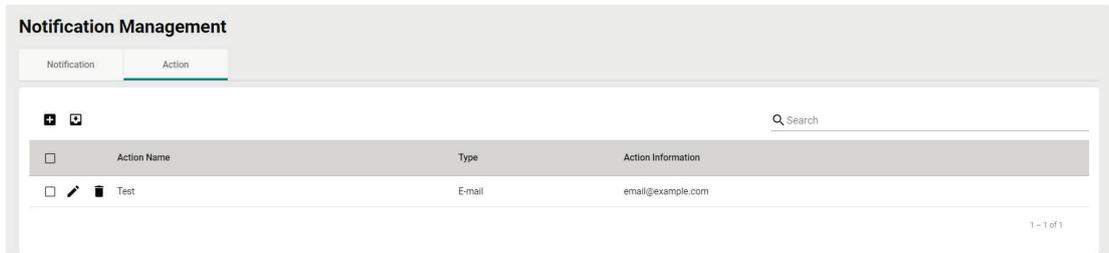

1. Navigate to **Menu** (☰) > **Notification Management**.

The **Notification Management** screen appears.

2. To register an action:

- a. Click the **Action** tab.

The **Action** tab displays a list of registered actions (if any).

- b. Click the **Add** (+) icon in the top right corner.

The **Add notification action** screen will appear.

Add notification action

Action Name *

Type *

Action Information *

Cancel Add

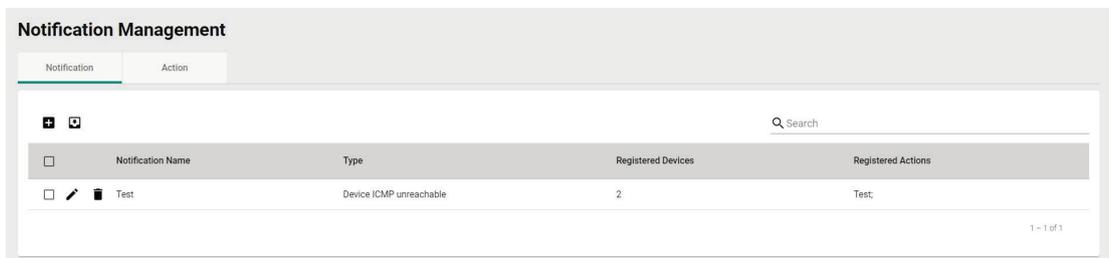

- c. In the **Action Name** field, type a name to describe the action.
- d. From the **Type** drop-down list, select one of the following actions:
 - E-mail**: Sends an email to the specified email address.
- e. Provide additional information required for the action (if any).
- f. Click **Add**.

The registered action appears in the table on the **Action** tab.

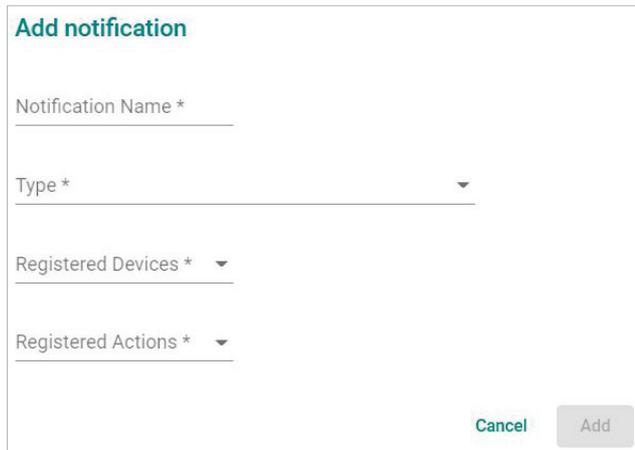

3. To add a new event notification:

- a. Click the **Notification** tab.

The **Notification** tab displays a list of configured event notifications (if any).

- b. Click the **Add** (+) icon in the top right corner.
The **Add** notification screen appears.

- c. In the **Notification Name** field, type a name to describe the event notification.
- d. From the **Type** drop-down list, select the event type.
- e. From the **Registered Devices** drop-down list, select the network device(s) you want to monitor.
- f. From the **Registered Actions** drop-down list, select the action that MXview One performs when the specified event is detected on the previously selected device(s).
- g. Click **Add**.
The event notification appears in the table on the **Notification** tab.

Editing or Exporting Registered Actions

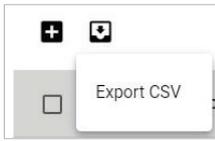

Use the **Action** tab on the **Notification Management** screen to edit registered actions or export a CSV file containing registered action information.

1. Navigate to **Menu** (☰) > **Notification Management**.
The **Notification Management** screen will appear.
2. Click the **Action** tab.
The **Action** tab displays a list of registered actions.
3. To edit a registered action:
 - a. Click the **Edit** (✎) icon next to the action you want to edit.
The **Edit notification action** screen will appear.

- b. Modify the following settings:
 - Action Name
 - Type
 - Action information
- c. Click **Apply**.
The **Action** tab appears and displays the updated action information.

4. To export data displayed on the Action tab:
 - a. Click the **Export** (📄) icon.

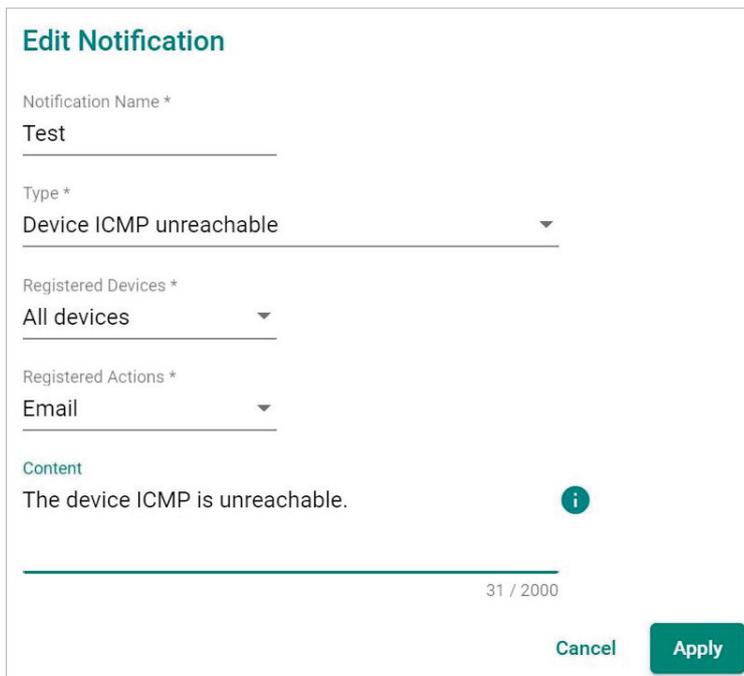

- b. MXview One exports the displayed action data as a CSV file.

Editing or Exporting Notification Configurations

Use the **Notification** tab on the **Notification Management** screen to edit configured notifications or export a CSV file containing notification configuration information.

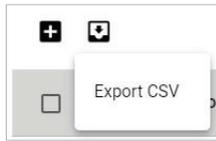

1. Navigate to **Menu** (☰) > **Notification Management**.
The **Notification Management** screen will appear.
2. Click the **Notification** tab.
The **Notification** tab displays a list of configured notifications.
3. To edit a notification:
 - a. Click the **Edit** (✎) icon next to the action you want to edit.
The **Edit notification** screen will appear.

A screenshot of the 'Edit Notification' screen. The title is 'Edit Notification'. It contains several form fields: 'Notification Name *' with the value 'Test'; 'Type *' with a dropdown menu showing 'Device ICMP unreachable'; 'Registered Devices *' with a dropdown menu showing 'All devices'; and 'Registered Actions *' with a dropdown menu showing 'Email'. Below these fields is a 'Content' section with the text 'The device ICMP is unreachable.' and a character count '31 / 2000'. At the bottom right, there are 'Cancel' and 'Apply' buttons.

- b. Modify the following settings:
 - Notification Name
 - Type
 - Registered devices
 - Registered Actions
 - c. Click **Apply**.
The **Notification** tab appears and displays the updated notification information.

4. To export data displayed on the **Notification** tab:

a. Click the **Export** (📄) icon.

b. Select **Export CSV**.

MXview One exports the displayed notification data as a CSV file.

Custom Event Management

The **Custom Event** screen provides information about all the custom events configured on MXview One. You can use the **Custom Event** screen to view whether a custom event is enabled or disabled, modify a custom event, or export custom event configurations as a CSV file.

Custom Event

All (3)

1 - 3 of 3

Configuring Custom Events

The Custom Event screen allows you to define your own events to monitor with flexible detection thresholds, severity levels, and duration times. You can also export the custom event configurations as a CSV file.

Custom Events Management

All (0)

Critical (0)

Warning (0)

Information (0)

<input type="checkbox"/>	Event Name	Enabled/Disabled	Condition	Description	Recovery Description	Duration	Registered Devices
--------------------------	------------	------------------	-----------	-------------	----------------------	----------	--------------------

0 of 0

1. Navigate to **Menu** (☰) > **Event Management** > **Custom Event**.
The **Custom Event** screen appears.
2. Click the **Add** (+) button in the top left corner of the screen.
The **Add custom event** screen will appear.

3. Select the default event status:
 - **Enabled:** MXview One monitors the event
 - **Disabled:** MXview One does not monitor the event
4. Select one of the following severity levels for the event:
 - Information
 - Warning
 - Critical
5. Click the **Device Properties** and select the device property to monitor.
6. Configure the following threshold criteria:
 - **Condition Operator:** Select the criteria operator for matching the condition value
 - **Condition Value:** Specify the value for the criteria operator to match
7. (Optional) In the **Description** field, type a string (up to 250 characters in length) to describe the custom monitoring.
8. (Optional) In the **Recovery Description** field, type a string (up to 250 characters in length) to describe how to recover from the event.
9. In the **Duration** field, users can specify how many times an event can happen without any action being taken. If the number of times the event happens exceeds the **Duration**, then MXview One will send an alert.
10. From the **Register Devices** drop-down list, select the devices to monitor for the custom event.
11. Click **Add**.
The custom event appears in the **Custom Event** table.

NOTE

If the threshold is set as '0', the threshold function will be disabled.

Viewing or Exporting Custom Event Settings

The **Custom Event** screen provides information about all the custom events configured on MXview One. You can use the **Custom Event** screen to view whether a custom event is enabled or disabled, modify a custom event, or export custom event configurations as a CSV file.

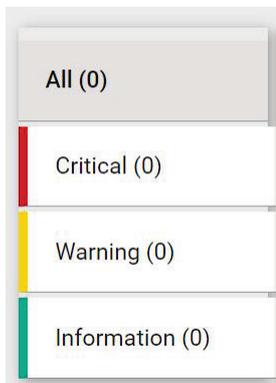

1. Navigate to **Menu** (☰) > **Event Management** > **Custom Event**.

The **Custom Event** screen will appear and displays the following information in a table format:

Column	Description
Event Name	The name of the event
Enabled/Disabled	The monitoring status of the event
Condition	The threshold criteria configured for the event
Description	The description of the event
Recovery Description	The recovery description of the event
Duration	The number of times of consecutive pollings for the event
Registered Devices	The number or registered devices that the event applies to

2. To search for information in the table, type a full or partial string that matches the value in any of the table columns.
MXview One filters the table to only display events with values that fully or partially match the specified string.
3. To filter the information in the table by event severity, click one of the color-coded severity levels in the left-side panel.

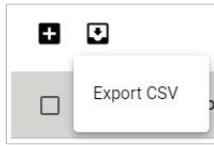

MXview One filters the table to only display events that match the selected severity level.

4. To sort the data in the table by a specific column, click the column heading.
MXview One sorts the table by the column.

5. To export data displayed on the **Custom Event** screen:

- a. Click the **Export** (📄) icon.

- b. Select **Export CSV**.

MXview One exports the displayed event data as a CSV file.

Enabling/Disabling or Editing Custom Events

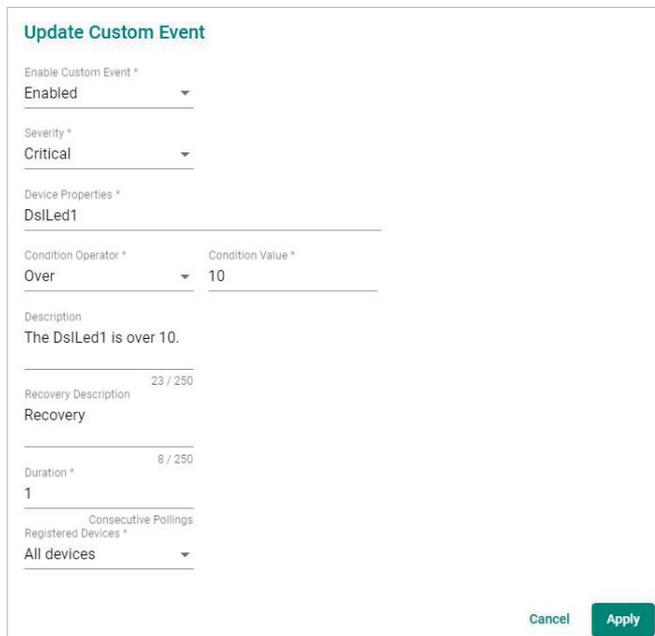

To enable or disable a custom event, edit the custom event settings.

1. Navigate to **Menu** (☰) > **Event Management** > **Custom Event**.

The **Custom Event** screen appears.

2. Click the **Edit** (✎) icon next to the event you want to enable/disable.

The **Update custom event** screen appears.

A screenshot of the 'Update Custom Event' screen. The title is 'Update Custom Event'. It contains several fields: 'Enable Custom Event *' with a dropdown menu set to 'Enabled'; 'Severity *' with a dropdown menu set to 'Critical'; 'Device Properties *' with a text field containing 'DslLed1'; 'Condition Operator *' with a dropdown menu set to 'Over' and 'Condition Value *' with a text field containing '10'; 'Description' with a text field containing 'The DslLed1 is over 10.'; 'Recovery Description' with a text field containing 'Recovery' and a character count '23 / 250'; 'Duration *' with a text field containing '1' and a character count '8 / 250'; and 'Registered Devices *' with a dropdown menu set to 'All devices' and a character count 'Consecutive Pollings'. At the bottom right, there are 'Cancel' and 'Apply' buttons.

3. From the **Enable Custom Event** drop-down list, select one of the following:

➤ **Enabled**

➤ **Disabled**

4. Modify any additional event settings you wish to change.

5. Click **Apply**.

The **Custom Event** screen will appear and displays the updated event information.

NOTE

If the threshold is set as '0', the threshold function will be disabled.

12. Reports

MXview One provides reports that summarize key information about your network devices.

Viewing Inventory Reports

Use the **Inventory Report** screen to view information about the devices on your network. You can also export the report as a CSV file or a PDF file.

Site Name	IP Address	Alias	Model	MAC Address	System Description	Firmware Version
client-generic	10.82.10.1	IKS-G6824A	IKS-G6824A	00:90:E8:7D:A7:1F	IKS-G6824A-4GTXSFP	V5.7 build 20011715

1. Navigate to **Menu** (☰) > **Reports** > **Inventory Report**.

The **Inventory Report** screen appears and displays the following information in a table format:

Column	Description
Site Name	The site that the device belongs to
IP Address	The IP address of the device
Alias	The unique name of the device
Model	The model number of the device
MAC Address	The MAC address of the device
System Description	The description of the device
Firmware Version	The firmware version of the device

2. To search for information in the table, type a full or partial string that matches the value in any of the table columns.

MXview One filters the table to only display results that fully or partially match the specified string.

3. To sort the data in the table by a specific column, click the column heading.

MXview One sorts the table by the column.

4. To export the report data:

- a. Click the **Export** (📄) icon.
- b. Select one of the following report formats:
 - Export CSV
 - Export PDF

MXview One exports the report data in the selected format.

13. Backups, Restores, and Compares

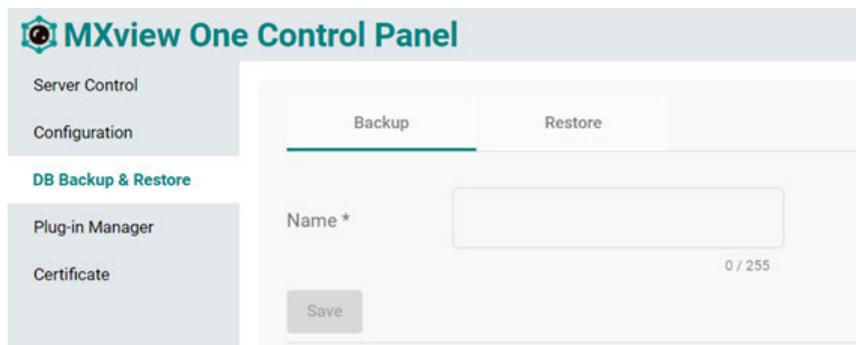

The MXview One web console provides several features to assist database backups and device configuration migrations. MXview One allows you to back up or restore configurations for multiple devices, and also compare changes between different versions of archived configuration files. You can also create scheduled jobs to automatically export/import device configurations or back up the MXview One database.

Backing Up the MXview One Database

Use the **DB Backup & Restore** screen on the **Control Panel** to back up the MXview One database.

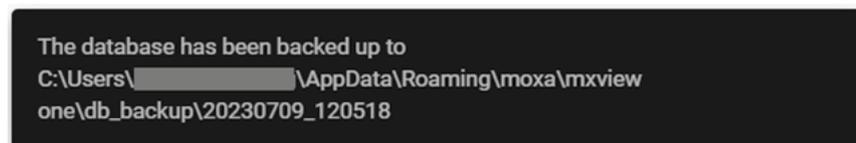

1. Navigate to **DB Backup & Restore** on the MXview One Control Panel.

The Database Backup & Restore screen appears.

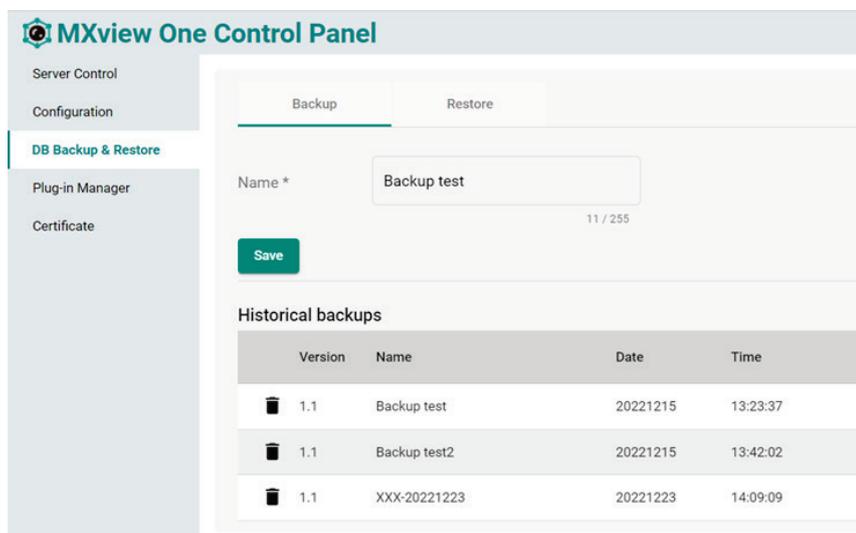

The screenshot shows the 'MXview One Control Panel' interface. On the left is a navigation menu with 'DB Backup & Restore' highlighted. The main area has two tabs: 'Backup' (selected) and 'Restore'. Below the tabs is a 'Name *' text input field, currently empty, with a character count '0 / 255' to its right. A 'Save' button is positioned below the input field.

2. Choose the **Backup** tab to start the process of backing up the database.
3. In the **Name** field, specify the backup file name.
4. Click **Save**.
5. The message that the file of the backup database has been stored in the specified directory will be displayed.

6. The **Database backup completed** will appear on the **Historical backups** list.

The screenshot shows the 'MXview One Control Panel' interface. The 'Backup' tab is selected. The 'Name *' field now contains 'Backup test' and the character count is '11 / 255'. The 'Save' button is now green. Below the input field is a section titled 'Historical backups' containing a table with the following data:

Version	Name	Date	Time
1.1	Backup test	20221215	13:23:37
1.1	Backup test2	20221215	13:42:02
1.1	XXX-20221223	20221223	14:09:09

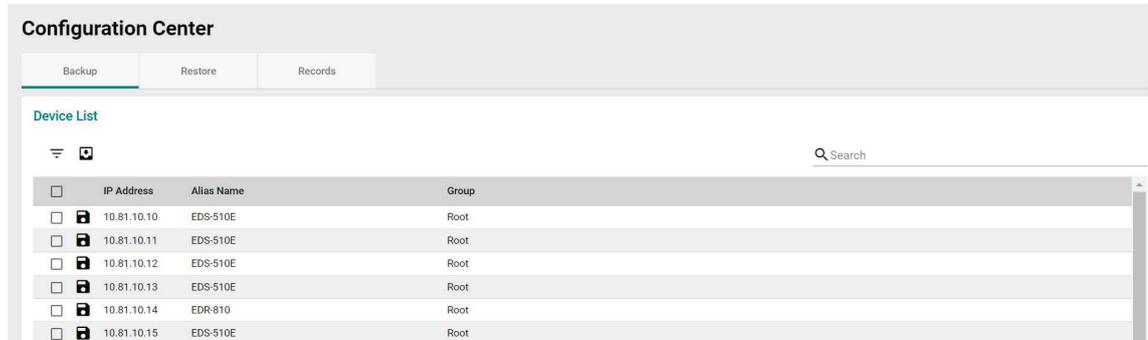

Backing Up Device Configurations

Use the **Device Configuration Center** screen to export configuration backup files from one or more devices.

1. Navigate to **Menu** (☰) > **Device Configuration Center**.
The **Device Configuration Center** screen appears.

2. Click the **Backup** tab.

Available devices will appear in the **Device List**.

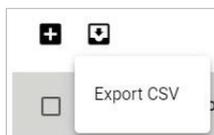

3. (Optional) Filter the devices in the **Device List**:

- a. Click the **Filter** (≡) icon.
- b. Specify any of the following criteria:
 - Group:** The group in the MXview One tree structure that the device is assigned to
 - IP Address:** The IP address of the device
- c. Click **Apply**.

MXview One filters the **Device List** according to the specified criteria.

4. To export the device list from all available devices:

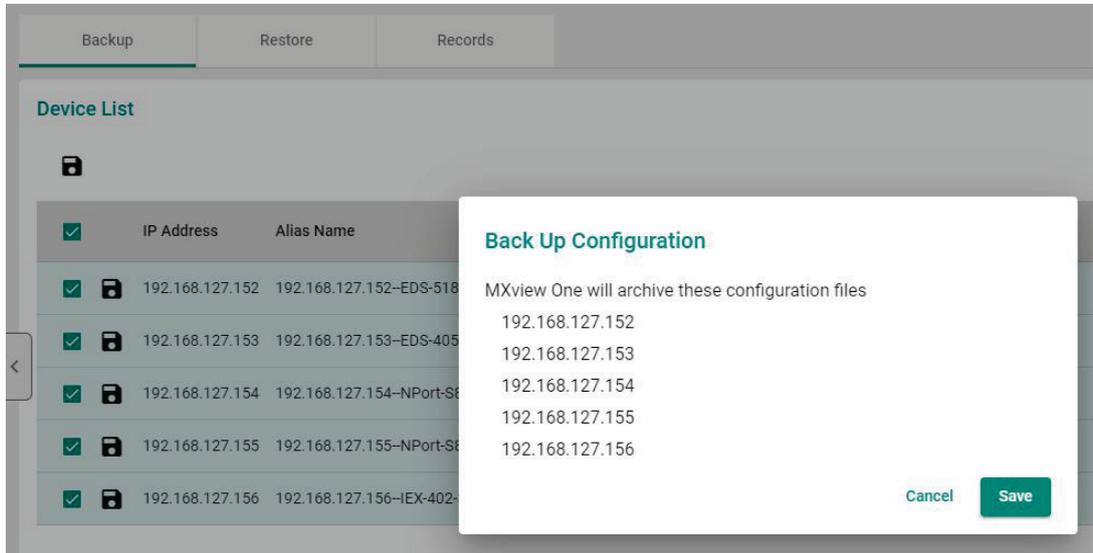

- a. Click the **Export** (📄) icon.

MXview One exports the 'All available devices' list as a CSV file.

5. To back up configurations from specific devices:
 - a. Select the check box next to the device(s) you want to back up.
 - b. Click the **Backup** (📁) icon in either of the following locations:
 - For a single device, click the **Backup** (📁) next to the selected device.
 - For multiple devices, click the **Backup** (📁) icon in the upper left corner of the screen.

The **Backup Configuration** screen appears.

- c. Click **Save**.
 MXview One archives configuration files from selected device(s) to the MXview One server and displays them in the **Records** tab. Also, MXview One will export configurations from the selected device(s) as a ZIP file.

For more information, please see the following topics:

Comparing Archived Configuration Files

NOTE

If MXview One compares two configuration files and they are the same, it will only leave the latest one. If the two configuration files are different, MXview One will keep both in the **Records** tab.

Restoring Device Configurations

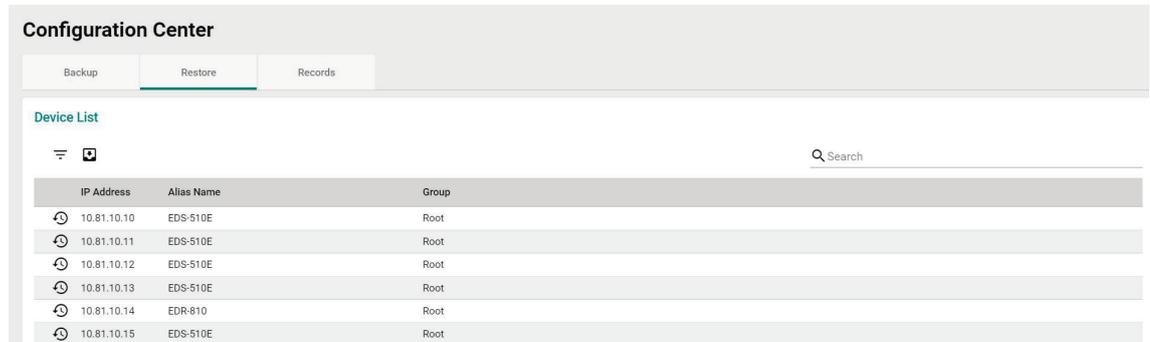

Use the **Configuration Center** screen to restore configurations to one or more devices by restoring an archived configuration from the MXview One server or importing a local configuration backup file (in INI format).

1. Navigate to **Menu** (☰) > **Device Configuration Center**.

The **Device Configuration Center** screen will appear.

2. Click the **Restore** tab.

Available devices will appear in the **Device List**.

3. (Optional) Filter the devices in the **Device List**:

- a. Click the **Filter** (≡) icon.

- b. Specify any of the following criteria:

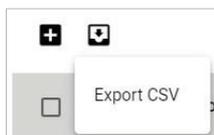

- Group:** The group that the device is assigned to
- IP Address:** The IP address of the device

- c. Click **Apply**.

MXview One filters the **Device List** according to the specified criteria.

4. (Optional) Export configurations from all available devices:

- a. Click the **Export** (📄) icon.

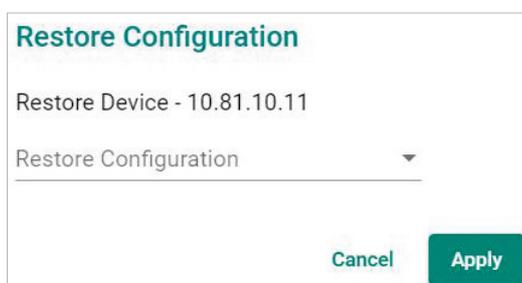

- b. Select **Export CSV**.

MXview One exports the 'All available devices' list as a CSV file.

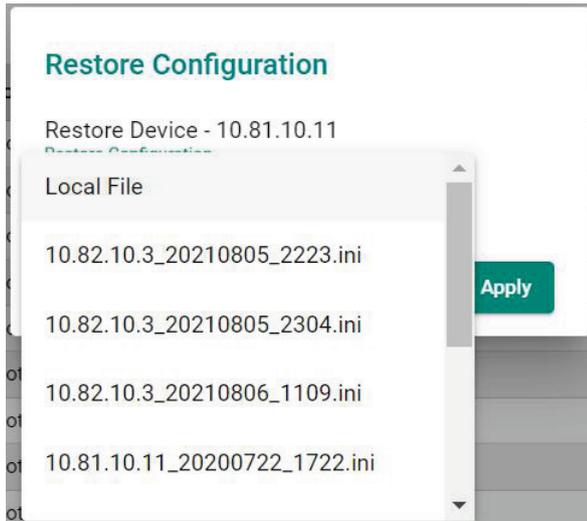

5. To restore an archived configuration file to a device:

- a. Click the **Restore** (↺) icon next to the **IP Address** of a device in the **Device List**.

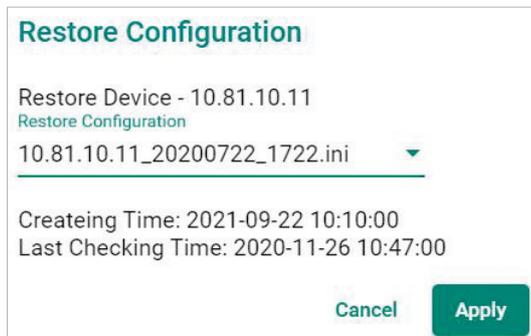

The **Restore Configuration** screen will appear.

- b. From the **Restore Configuration** drop-down list, select the archived device configuration to restore.

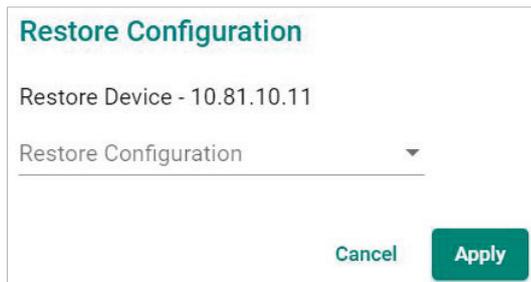

- c. Click **Apply**.

MXview One imports the configuration file to the selected device.

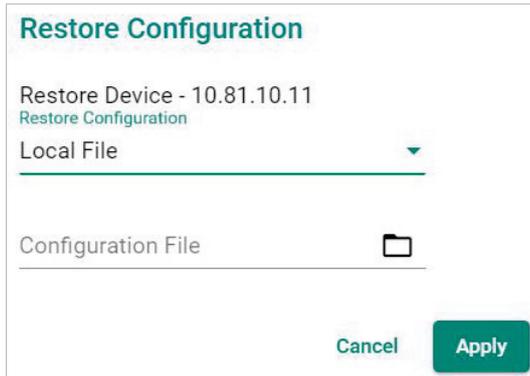

6. To import a local configuration file to a device:
- a. Click the **Restore** (↺) icon next to the **IP Address** of a device in the **Device List**.

The **Restore Configuration** screen appears.

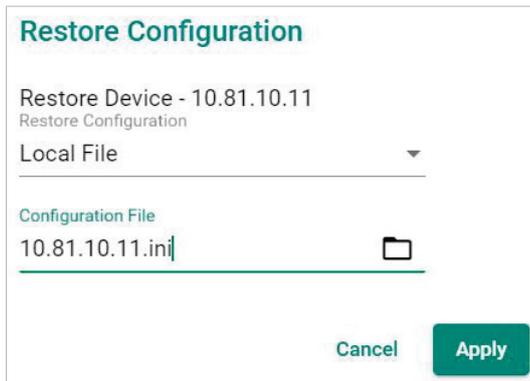

- b. From the **Restore Configuration** drop-down list, select **Local File**.

- c. Click the **Configuration File** field to select the configuration file.

- d. Select the configuration file to import and click Open.
- e. Click **Apply**.

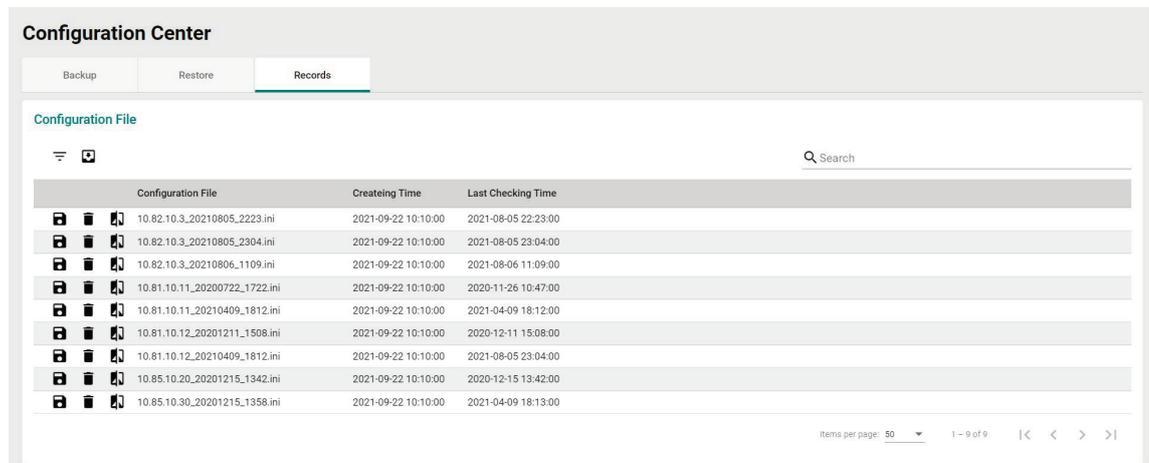

MXview One imports the configuration file to the selected device.

Comparing Archived Configuration Files

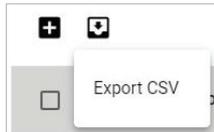

Use the **Device Configuration Center** to compare changes in the history of saved configuration files.

1. Navigate to **Menu** (☰) > **Device Configuration Center**.
The **Device Configuration Center** screen appears.
2. Click the **Records** tab.

A list of archived backup configuration files appears.

3. (Optional) Filter the list of configuration files:
 - a. Click the **Filter** (☰) icon.
 - b. Specify any of the following criteria:
 - Group:** The group that the device is assigned to
 - Start Date:** The earliest file creation date
 - Start Time:** The earliest file creation time on the Start Date
 - End Date:** The latest file creation or update date
 - End Time:** The latest file creation or update time on the End Date
 - c. Click **Apply**.
4. (Optional) Export configurations from all available devices:
 - a. Click the **Export** (📄) icon.

- b. Select **Export CSV**.
MXview One exports all the devices information as a CSV file.
5. Click the **Compare** (🔍) icon next to the configuration file you want to compare.
The **Compare Configurations** screen will appear.

Compare Configurations

Compare Basement: 192.168.127.13_20220503_1818.ini
Device List *
 192.168.127.13

Compare Target
 192.168.127.13_20220503_1819.ini ▼

Cancel Compare

6. Select the device from the **Device List** drop-down list.
7. Select the target configuration file to compare from the **Compare Target** drop-down list.

8. Click **Compare**.

MXview One will display a comparison of the selected configuration files.

```
Compare Configurations

Compare Basement: 192.168.127.13_20220503_1818.ini
Device List *
192.168.127.13

Compare Target
192.168.127.13_20220503_1819.ini

" System configuration "
#####
# [SwitchName]: Switch Name
# --> max. length = 35 words
SwitchName      Managed Redundant Switch 02810

# [Location]: Switch Location
# --> max. length = 80 words
- Location      Switch Location

+ Location      Switch Location Test

# [SysDescr]: Switch Description

The inserted, deleted, and modified lines in the configuration will be highlighted.

NOTE

The green lines are the configurations of Compare Target. The red lines are the configurations of Compare basement.

Creating Maintenance Scheduler for Database/Configuration Backups

Use the **Maintenance Scheduler** to automatically export/import device configurations or back up the MXview One database on a predefined schedule.

1. Navigate to **Menu** (☰) > **Administration** > **Maintenance Scheduler**.
The **Maintenance Scheduler** screen appears.
2. (Optional) Search a previously saved scheduled job, type a job name in the search box.
The **Maintenance Scheduler** table displays a list of matching scheduled jobs.
3. Click the **Add** (+) button.
The **Add job** screen appears.
4. Specify the Job Name.
5. Select one of the following options from the Action drop-down box:
 - **Export Configuration**
 - **Import Configuration**
 - **Database Backup**
6. Type a **Description** for the job.
7. Select the **Registered Devices** that apply.

8. Select a job frequency from the **Repeat Execution** drop-down box:
 - Once
 - Daily
 - Weekly
 - Monthly
9. Specify the **Start Date** to begin executing the scheduled job.
10. Specify the **Execution Time** on the Start Date to run the scheduled job.
11. Click **Add**.

MXview One will display the scheduled job on the **Maintenance Scheduler** table and will execute the job according to the defined schedule.

- b. Click the **Regenerate the API Key** (🔄) icon.

MXview One will regenerate the API key for the selected application.

NOTE

Regenerating the API key will prevent any APIs that use the old API key from working properly.

5. To delete an application:
 - a. Select the check box next to the **Application Name**.
 - b. Click the **Delete** (🗑️) icon in the top left corner of the screen.
MXview One will delete the application.

NOTE

Deleting the application will prevent any APIs that use the old API key from working properly.

6. To view API reference documentation, navigate to **Menu** (☰) > **Help** > **API Documentation**.
The **MXview One API** screen will appear and display the reference document for supported MXview One APIs. Click **API user guide** below the MXview One API title, where you can find the guidelines for using the RESTful API functions.

MXview One API 1.0.0 OAS3

Resource

- GET `/resources/icons/ur1/{ur1}` Get device icon
- GET `/resources/icons/{ur1}` Get the icon of a site
- GET `/resources/panel_images/ur1/{ur1}` Get the panel image of a device

Embedding Web Widgets

MXview One allows you to embed the Topology Map and Recent Events widgets from the MXview One **Topology** screen in third-party applications.

1. Navigate to **Menu** (☰) > **Integration** > **Embedded Web Widget**.
The **Embedded Web Widget** screen will appear.
2. From the **Select API Key** drop-down list, select the **Application Name** for the API key you want to use.

Select API key

Demo

3. From the **Select Layout** drop-down list, select the widget(s) you want to embed:
 - **Topology and Recent Events:** Embeds both the Topology Map and Recent Events widgets in the target application
 - **Topology:** Embeds only the Topology Map in the target application
 - **Recent event:** Embeds only the Recent Events widget in the target application
4. Copy and paste the widget link for the target application:
 - To embed the widget in a web application, click the **Copy link** (📄) icon in the **Link** section.

15. Wireless Add-on Module

MXview One supports several optional modules that extend the functionality of the main module. These modules require a separate license to use.

Introduction

The MXview One Wireless Add-on Module provides a set of tools to help you monitor and troubleshoot your wireless network through MXview One and supports up to a total of 200 wireless APs and clients. The add-on gives you clear, real-time information about the status of your wireless network including the client roaming status and key wireless performance indicators such as SNR and noise level. The wireless module also instantly notifies you of any problems with your wireless devices and helps you narrow down the root cause of the problem, allowing for quick and easy troubleshooting.

System Requirements

The computer that the MXview One Wireless Add-on Module is installed on must satisfy the following system requirements based on the maximum capacity of 200 wireless APs and clients:

	System Requirements
CPU	2 GHz or faster dual core CPU
RAM	8 GB or higher
Hard Disk Space	20 to 30 GB for 1 month of performance and event history recording
OS	Windows 10 (64-bit) Windows 11 (64-bit) Windows Server 2016 (64-bit) Windows Server 2019 (64-bit)
Browser Requirements	Chrome: Version 76 or later Firefox: Version 69 or later Microsoft Edge: Version 79 or later

Supported Devices

The MXview One Wireless Add-on Module supports the following wireless devices:

- AWK-3131A Series (firmware v1.16 or higher)
- AWK-4131A Series (firmware v1.16 or higher)
- AWK-1131A Series (firmware v1.22 or higher)
- AWK-1137C Series (firmware v1.6 or higher)
- AWK-1151C Series (firmware v2.0 or higher)
- AWK-3252A Series (firmware v2.0 or higher)
- AWK-4252A Series (firmware v2.0 or higher)

Getting Started With the Wireless Add-on Module

In order to use the MXview One Wireless Add-on module, you will need to activate it first. You can choose to activate a new license, or enable the wireless 60-Day free trial through the license management page.

License Management

MXview One

	License Mode: Authorized Current Nodes: 47 Licensed Nodes: 250	Wireless Add-on License Mode: Authorized
---	--	--

[Moxa License Site](#)

Add New License License Type

Licenses

Re-activate License
Use both the Deactivation Code and a User Code to re-activate your license.

Re-activate

The system will automatically restart after you activate the module. A message will appear telling you to wait 10 seconds while the module activates. Once done, click **OK** to refresh your browser and enable the Wireless Add-on features.

Please Wait

The operation will finish in 10 seconds.

OK

- For detailed information on how to activate the MXview One Wireless Add-on Module, refer to **License Management**.
- To add wireless devices to your MXview One network, refer to **Using Device Discovery**.

NOTE

Please activate the Node-based License first and then the Wireless Add-on License.

Wireless Module Features

The MXview One Wireless Add-on Module offers a set of features specifically designed to help you monitor and troubleshoot your wireless network more easily.

Main Dashboard

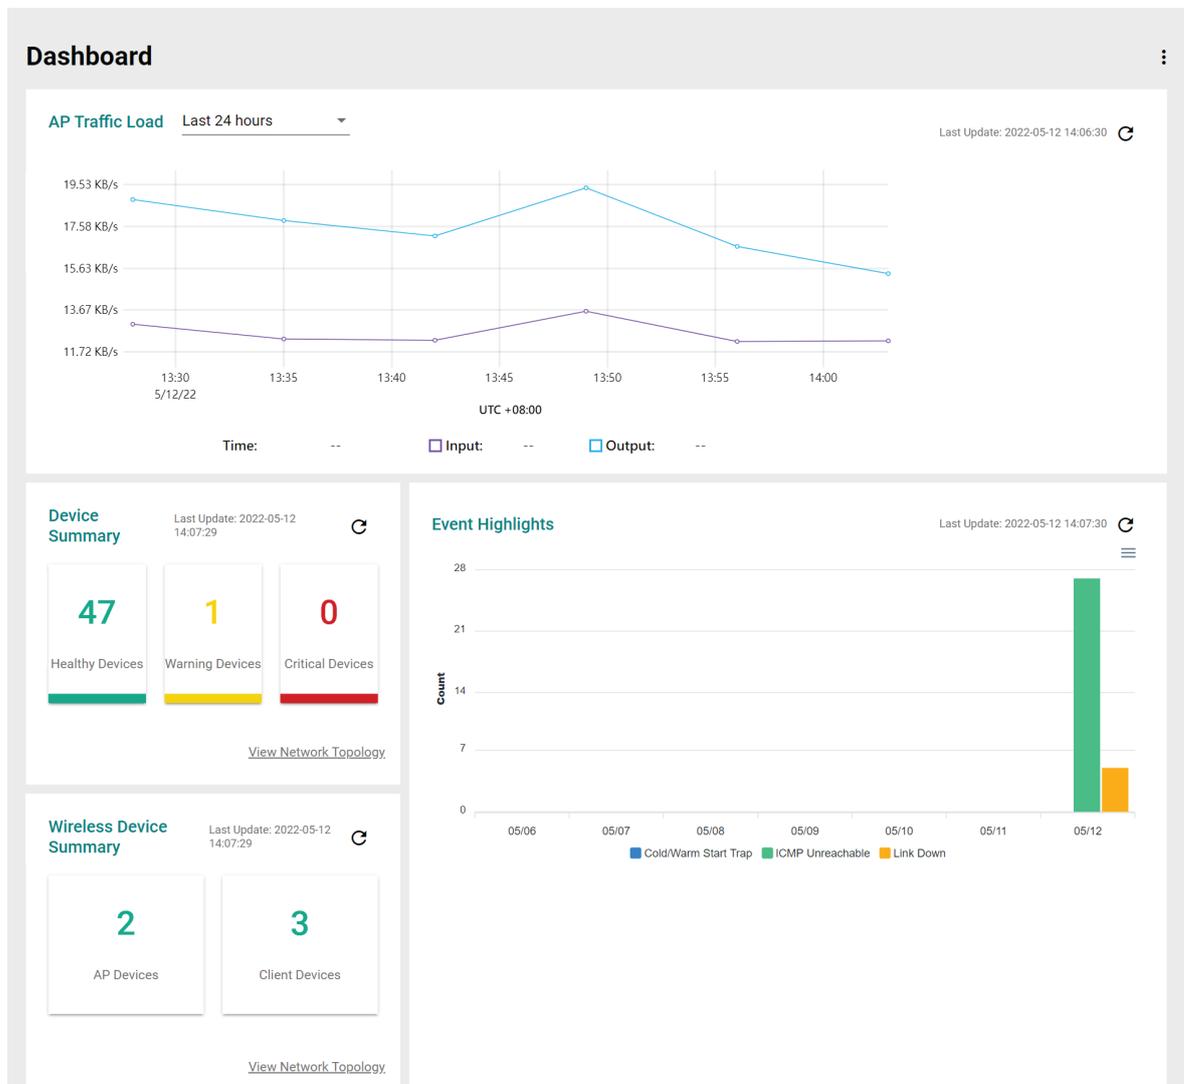

If the wireless module is activated, the MXview One Dashboard will show two additional types of information: AP Traffic load and the Wireless Device Summary.

The AP Traffic Load graph shows the aggregated traffic of all the AP devices monitored by MXview One. You can select a specific time to check the wireless network status at that time. MXview One provides three time sections: **Last 24 hours**, **Last week**, and **Last 2 weeks**.

The Wireless Device Summary shows the number of deployed wireless devices. Clicking one of the cards will direct you to the Wireless Device Summary screen where you can find more detailed information about the wireless devices. Refer to Chapter 5: **Dashboard Widgets** for more information about the other cards on the dashboard.

To access the Dashboard, navigate to **Menu** (☰) > **Dashboard**.

To refresh the data displayed in all the widgets, click the **Settings** (⋮) icon in the top-right corner of the screen and select **Refresh All**.

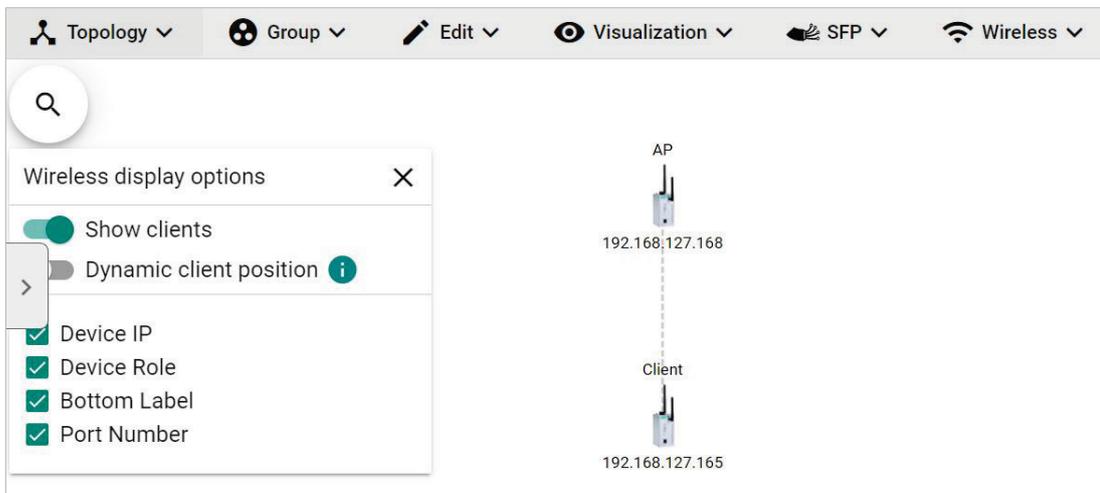

Dynamic Wireless Client Roaming

The MXview One Wireless Add-on Module features dynamic wireless roaming display, which updates roaming connections of wireless clients in real-time. Instead of using LLDP data to draw links between devices, MXview One uses both the client list data from the wireless AP and AP data from the wireless client to detect wireless roaming changes.

To enable the dynamic wireless client roaming function, toggle the **Dynamic client position** option. In this mode, wireless clients will automatically move below the AP they connect to when roaming. The link between the client and AP on the topology will also change dynamically if the client connects to another AP.

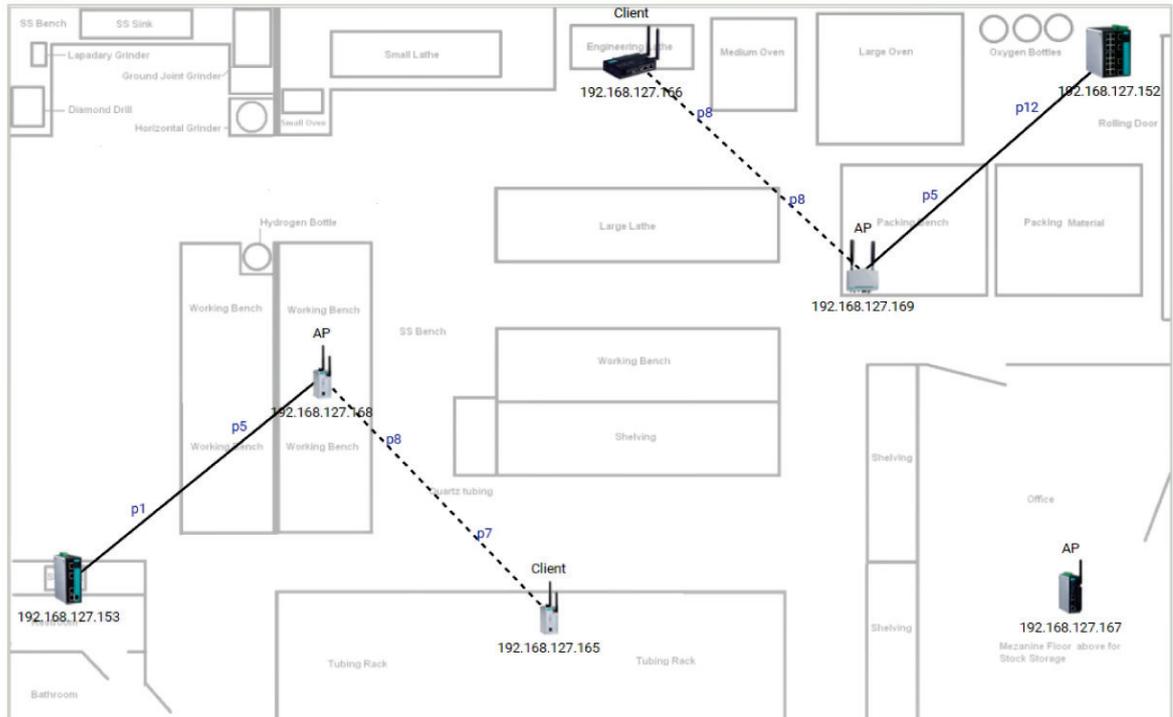

Refer to the table below for a description of each display option.

Option	Description
Show clients	Toggle this option on or off to show or hide wireless clients on the topology
Dynamic client position	Enable this option to have wireless clients move to a position close to the AP they are associated with Disabling this option will return the clients to their original position

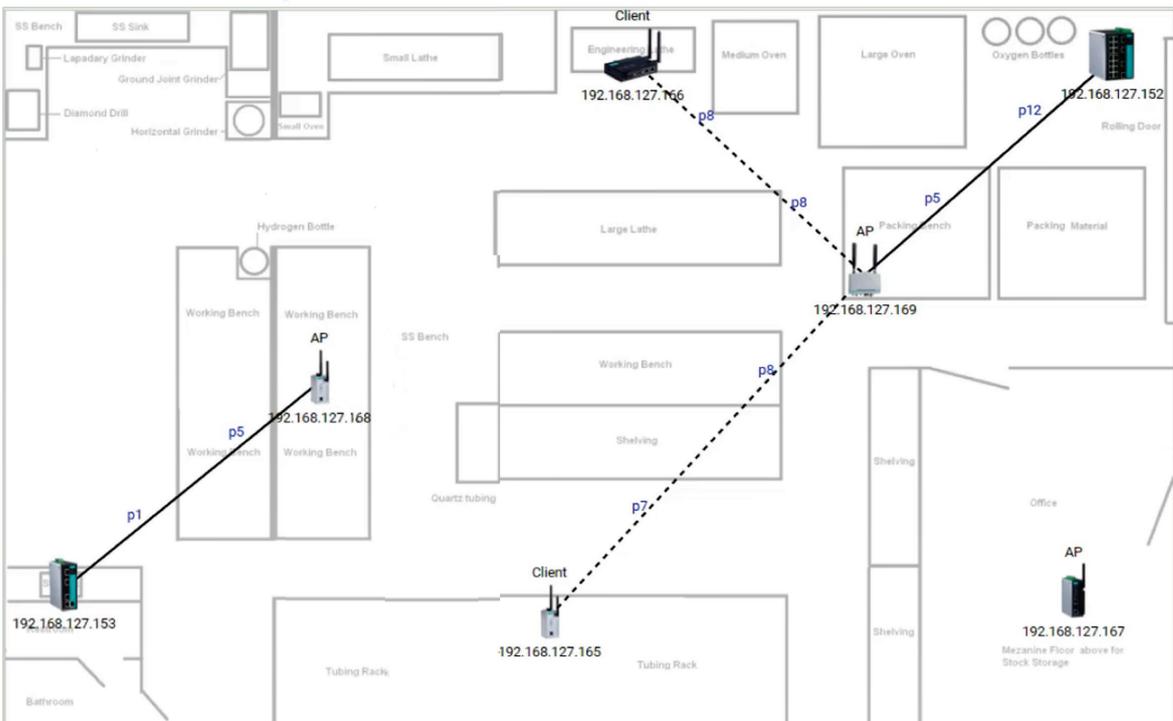

The following diagrams are an example of the dynamic roaming display showing dynamic client-AP link changes.

In the first scenario there are two wireless APs that each have one client connected to it.

When the client roams to another AP, MXview One will automatically redraw the link to the new AP on the wireless topology diagram.

AP/Client Device Dashboard

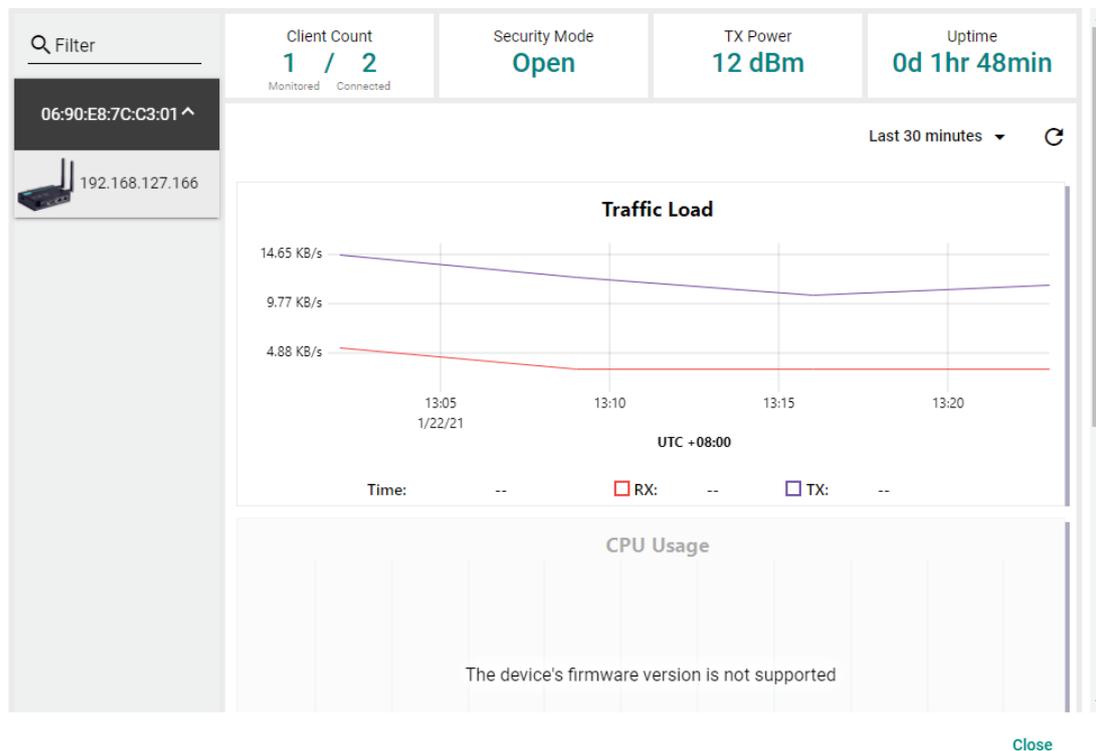

Use the **AP/Client Device Dashboard** screens to see detailed information and performance statistics of the client or AP.

To access the AP/Client Device Dashboard, click on any wireless AP or client device's icon on the topology diagram and click **Device Dashboard** in the toolbar.

AP Device Dashboard

AP Dashboard-192.168.127.169--AWK-4131A

The AP Device Dashboard shows the following information:

Parameter	Description
Client Count	Monitored
	Connected
Security Mode	
TX Power	
Uptime	
Traffic Load	
CPU Usage	
Memory Usage	

Client Device Dashboard

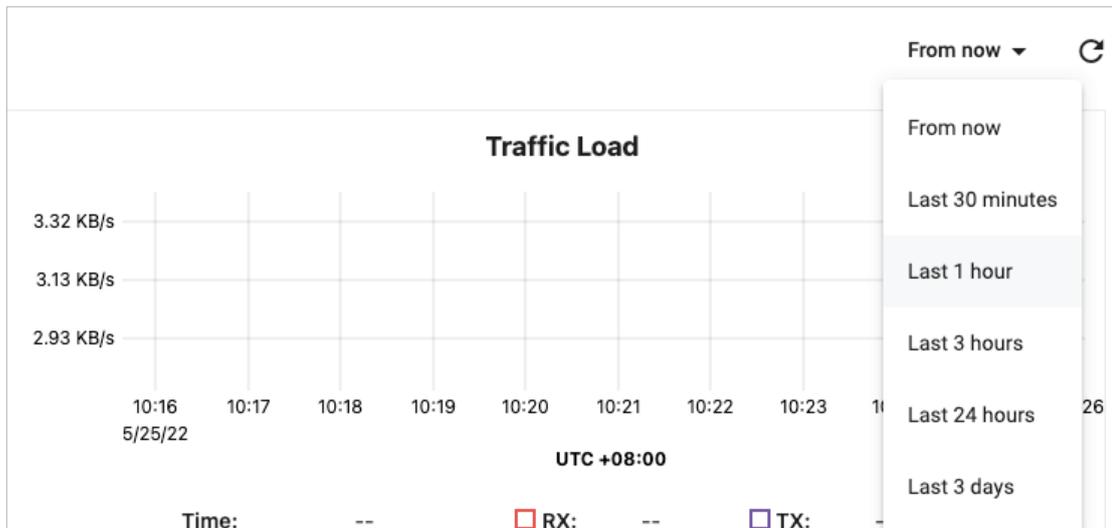

Client Dashboard-192.168.127.166--AWK-1137C

The Client Device Dashboard shows the following information:

Parameter	Description
BSSID	The BSSID of the wireless AP the client is connected to
Security Mode	The Security Mode of the client: Open, WEP, WPA, or WPA2
Link Speed	The real-time bandwidth of the connection to the AP
Connected	The total time the wireless client has been connected to the AP
SNR	The current and historical Signal-to-Noise ratio of the client If the wireless device has multiple antennas, the SNR of each antenna will be separately shown as SNR-A and SNR-B
Signal Strength	The current and historical signal strength of the client
Noise Floor	The current and historical noise floor of the client
Traffic Load	The current and historical traffic throughput of the wireless interface
CPU Usage	The current and historical CPU usage of the client (only supported by certain firmware versions)
Memory Usage	The current and historical memory usage of the client (only supported by certain firmware versions)

You can view the device diagnostics and usage parameters in real-time or recall the history for up to the last 3 days from the drop-down menu in the top-right. You can zoom in on the timeline to examine a narrower time period. Double-click the timeline to return to the original view.

Wireless Device Summary

The Wireless Device Summary screen provides detailed information about all the AP and client devices including the device's IP and MAC address, operation mode, and current signal strength.

To access the Wireless Device Summary screen, expand the **Wireless** (📶) menu in the toolbar and click **Wireless Device Summary**.

Click **Back** in the top-left corner to return to the topology view.

Wireless Roaming Playback

Through the Wireless Roaming Playback screen, you can recall the roaming history of a specific client. By default, MXview One will keep the roaming playback data for 30 days.

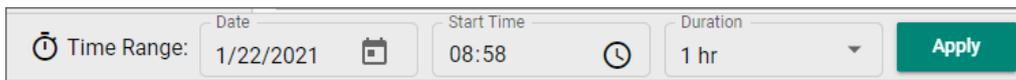

To access the Wireless Roaming Playback screen, expand the **Wireless** (📶) menu in the toolbar and click **Wireless Roaming Playback**.

Click **Back** in the top-left corner to return to the topology view.

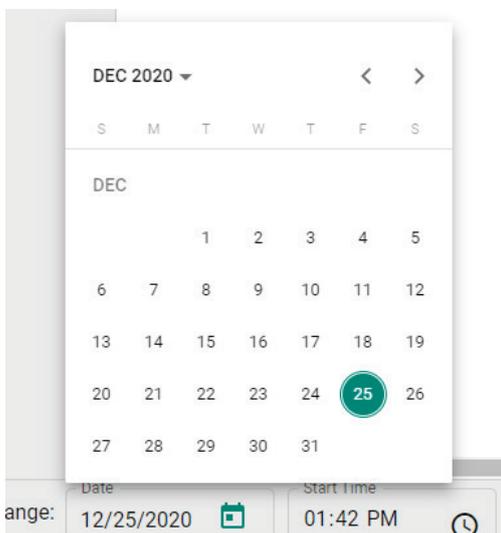

On the left-hand side is a list of wireless clients, in the center is the topology map, and located at the bottom is the playback progress bar. Select any client from the list and click **Play** (▶) to start playing the wireless roaming history for the selected time range. You can adjust the playback speed by clicking the **Decrease Speed** (◀) or **Increase Speed** (▶) button to increase or decrease the playback speed respectively.

To view the history for a specific time and date, click () to choose the starting date, set the time in the Start Time field, select the duration of the playback history from the Duration drop-down menu, and click **Apply**.

Time Range: 1/22/2021 08:58 1 hr

The progress bar also displays the RSSI value at the time. In addition, the red dots indicate the time when the wireless client roamed to a different AP. You can zoom in on the timeline to examine a narrower time period. Click **Apply** to return to the original view.

16. Power Add-on Module

MXview One supports several optional modules that extend the functionality of the main module. These modules require a separate license to use.

Introduction

The MXview Power Add-on Module provides a set of features to help you monitor and troubleshoot your power substation network that follows the IEC 61850 standard and supports switches that have the PRP/HSR function with deep visualization. To monitor the IED (Intelligent Electronic Device), which is an important device that can receive data and issue commands on the network, MXview Power supports the MMS protocol to view and provide the status of the IED. Furthermore, there is a critical packet called GOOSE in power substation networks, and MXview Power can also help customers troubleshoot GOOSE events such as GOOSE Timeout and GOOSE Tampered. The power module instantly notifies you of any problems with your power devices and helps you narrow down the root cause of the problem, allowing for quick and easy troubleshooting.

System Requirements

The computer that the MXview Power Add-on Module is installed on must satisfy the same system requirements as those required for MXview One. See **System Requirements** in Chapter 1 for more information.

Supported Devices With PRP/HSR Features

PRP/HSR features can be visualized with the devices that support PRP/HSR functions or have a PRP/HSR module.

- PT-G503 Series (firmware v5.1 or higher)
- PT-G510 Series (firmware v6.4 or higher)
- PT-G7728 Series and LM-7000H-2GPHR module (firmware v6.2 or higher)
- DA-820C Series and DN-PRP-HSR-I210 or DA-PRP-HSR-I210 (OS Win 10 or higher)

Getting Started With the Power Add-on Module

In order to use the MXview Power Add-on module, you will need to activate it first. You can choose to activate a new license or enable the Power 60-day free version through the License Management page.

The screenshot shows the 'License Management' interface. At the top, there are two license cards. The first is for 'MXview One' with a document icon and a ribbon seal. It lists 'License' with 'Mode: Authorized', 'Current Nodes: 0', and 'Licensed Nodes: 3'. Below it is a link to 'Moxa License Site' and a green 'Add New License' button. The second card is for 'Power Add-on License' with 'Mode: Authorized'. Below these cards is a 'Re-activate License' section with instructions: 'Use both the Deactivation Code and a User Code to re-activate your license.' and a 'Re-activate' button.

The system will automatically restart after you activate the module. A message will appear telling you to wait 10 seconds while the module activates. Once done, click **OK** to refresh your browser and enable the Power Add-on features.

The dialog box has a title 'Activating...' in teal. Below the title, it says 'The operation will finish in 10 seconds.' In the bottom right corner, there is an 'OK (9)' button.

- For detailed information on how to activate the MXview Power Add-on Module, refer to **Chapter 4: License Management**.
- To add power devices to your MXview One network, refer to **Using Device Discovery**.

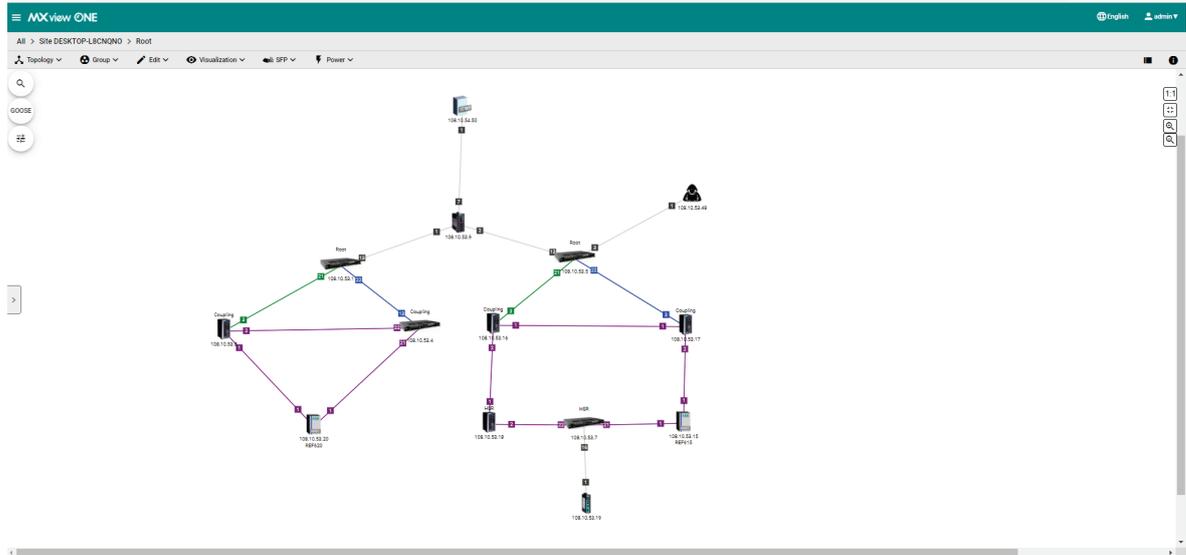

NOTE

Please activate the Node-based License and then the Power Add-on License.

Power Module Features

The MXview Power Add-on Module offers a set of features specifically designed to help you monitor and troubleshoot your power substation network more easily.

Topology

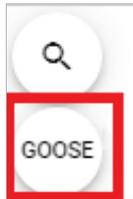

After you enable the MXview Power add-on module, you will see the panel has changed on the left hand-side.

GOOSE panel

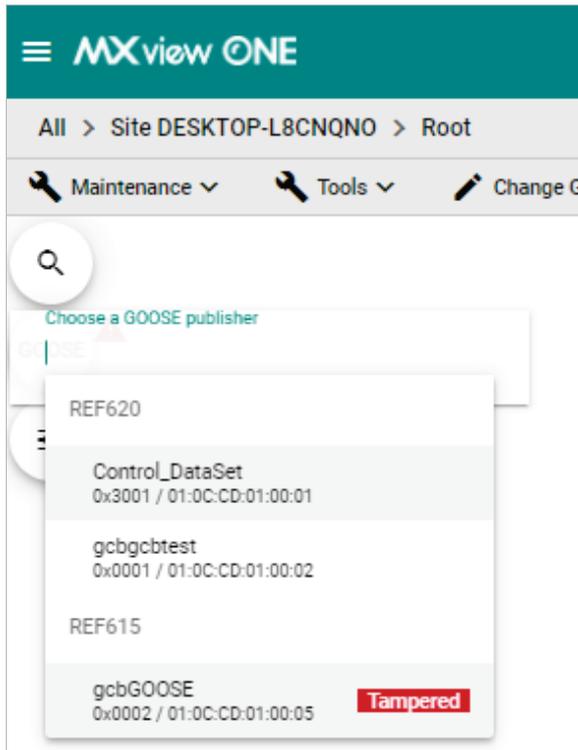

1. Before you import the SCD file, the GOOSE panel will be displayed in light gray. At this point, it has limited functionality.

2. Once you have imported the SCD file via **Power > Import SCD**, you can find the IED as a GOOSE publisher identity via the GOOSE panel.
 - a. Click **GOOSE panel**.

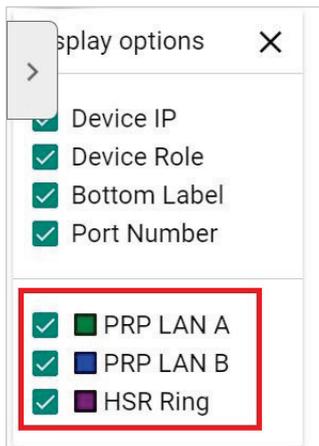

- b. Scroll down or type the GOOSE-related information, such as IED name or GoCB name.

Display Options

1. Once you have activated the MXview Power add-on module, you can see the display options include extra functions such as PRP LAN A, PRP LAN B, and HSR Ring.
2. If the box is checked, you can see the color of the link for the PRP/HSR on the topology. If you uncheck the box, then the link will not display the color for the PRP/HSR function.

NOTE

PRP LAN A is represented by a green line, PRP LAN B by a blue line, and HSR Ring by a purple line.

NOTE

MXview One cannot guarantee that it can draw the link of the topology for non LLDP devices, such as an IED device. However, you can draw the link of the topology manually by clicking **Add Link**.

Import SCD

The SCD (Substation Configuration Description) file includes the information of the critical packet – GOOSE message in the network. To visualize the GOOSE message flow in MXview Power, the user has to import the SCD file.

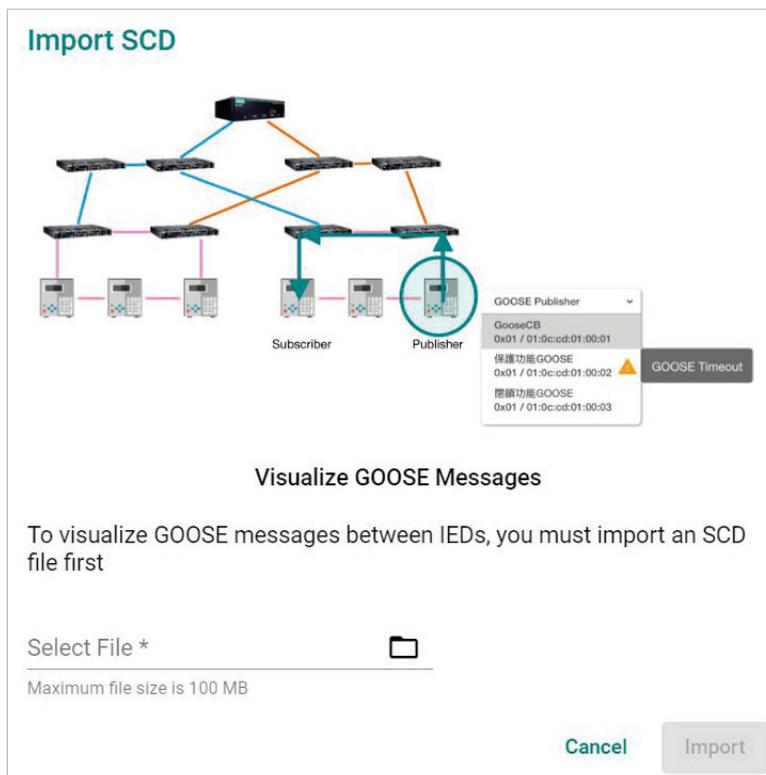

1. Navigate to **Menu** (☰) > **Topology**

The **Topology** screen will appear and display the Topology Map by default.

2. To import the SCD file to the Topology Map:

- a. Click **Power > Import SCD**.

The **Import SCD** screen will appear.

- b. Upload the SCD file by using one of the following methods:

- The file size must be less than 100 MB.
- Click **File** (📁) icon to upload the SCD file.

3. Click **Import**.

4. MXview Power will import the uploaded SCD file into the Topology Map.

If the SCD file is correct, the user will see the message below.

If the SCD file content cannot find the devices in the Topology, then MXview Power will display the missing devices and provide the steps for the user to resolve the problem.

Failed to Import SCD File

⚠ Can't find the following device(s):

192.168.127.4

Try these steps to resolve issues.

- 1. Add the missing device(s)**
Click "Edit" → "Add Device".
- 2. Import the SCD file again**
Click "Power" → "Import SCD".

GOOSE Message

MXview Power can display the GOOSE Message information on the Topology or in the IED Device Property panel by importing the SCD file. Moxa's PT switch, which was specifically designed for use in power substation systems, can detect GOOSE events. MXview Power can collect the GOOSE events and alert users when there is something wrong. Users can follow the step-by-step guidelines to solve the GOOSE events.

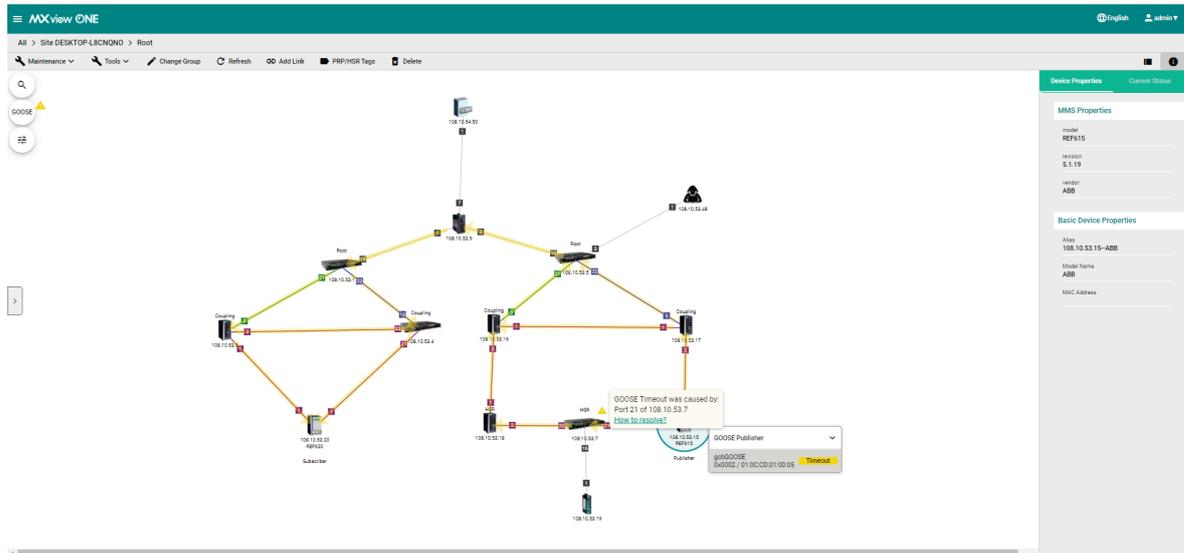

GOOSE Flow

There are two roles for IED device(s): Subscriber and Publisher. The topology displays the flow of the GOOSE packet, which starts from the Publisher and ends at the Subscriber. The route you see on the GOOSE flow is not the completed GOOSE packet publishing direction. The purpose of displaying the GOOSE flow is to troubleshoot the path of the GOOSE packet for certain cases such as a GOOSE event (e.g. GOOSE Timeout, GOOSE Tampered), a device malfunction, or a link going down. The GOOSE flow will show the path the packet took to enable faster troubleshooting and minimize substation network recovery times.

GOOSE Timeout

When a GOOSE Timeout event happens, MXview Power can display the event and indicate the possibly affected devices on the Topology by placing a yellow triangle next to them. When users click on the IED device, it will display the specific GOOSE message and will also include a Timeout status notification.

Click the **How to resolve** link and MXview Power will provide you with step-by-step instructions to solve the problem.

Resolve GOOSE Timeout Issue

GOOSE Timeout was caused by:
Port 21 of 108.10.53.7

Try these steps to resolve GOOSE Timeout issues.

- 1. Check the IED(s) settings**
Make sure the GOOSE publish/subscribe messages of the IED are set correctly.
- 2. Make sure the port is not in link down status**
Check to make sure the port of each device in the GOOSE flow (gcbGOOSE/0x0002/01:0C:CD:01:00:05) is not in link down status.
- 3. Make sure the port does not have any TX/RX errors**
Click on a link, choose "Link Traffic" to see the "Packet Error Rate" section. Make sure the port does not have any errors.
- 4. Check if the fiber ports exceed certain thresholds**
Click "SFP" → "SFP List". Make sure the ports do not exceed certain thresholds.

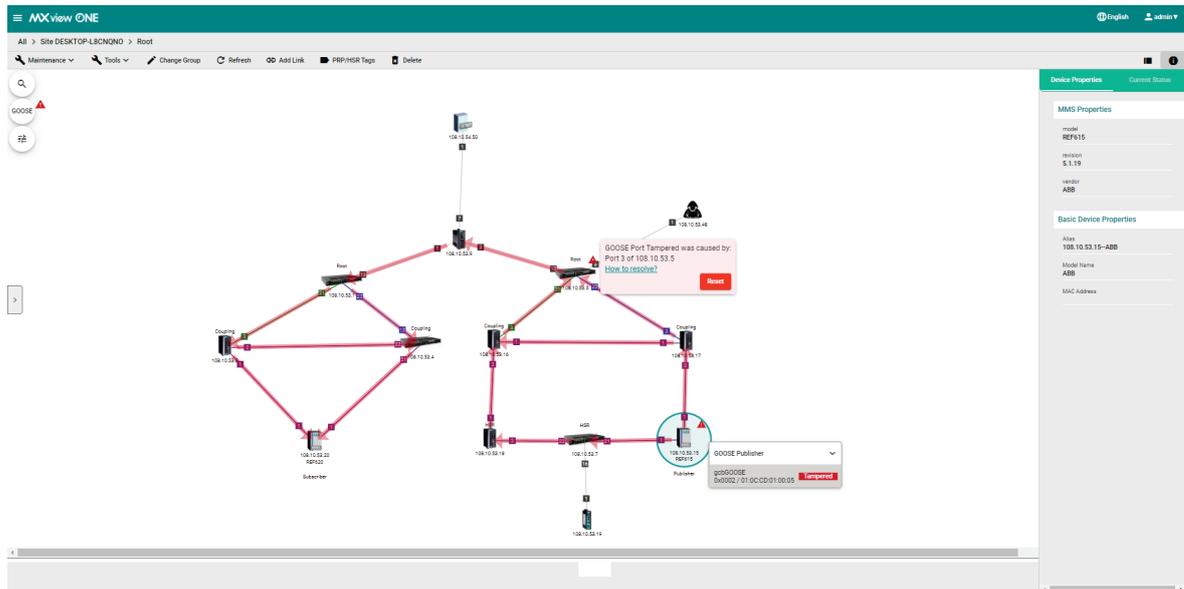

Still not working?
Remove the SFP module and install it again.
If you have further questions, contact your [channel partner](#) first.
Contact [Moxa Technical Support](#) if you still need additional support.

Once the problem is solved, MXview Power will provide the recovery status in the Recent Event panel and the yellow triangle will disappear.

GOOSE Tampered

When a GOOSE Tampered event happens, MXview Power can display the event and provide the possibly affected devices on the Topology by placing a red triangle next to them. When users click on the IED device, it will display the specific GOOSE message and will also include a Tampered status notification.

Click the **How to resolve** link and MXview Power will provide you with step-by-step instructions to solve the problem.

Resolve GOOSE Port Tampered Issue

GOOSE Port Tampered was caused by:
Port 3 of 108.10.53.5

Try these steps to resolve the GOOSE Port Tampered issue

1. Check the IED(s) settings
Make sure the GOOSE publish/subscribe messages of the IED are set correctly.
2. Check the port status
Please check port 3 status of 108.10.53.5.

Still not working?
If you have further questions, contact your [channel partner](#) first.
Contact [Moxa Technical Support](#) if you still need additional support.

In order to enhance security, MXview Power allows users to click the **Reset** button to clear the events log for the devices. Once the event logs are cleared, MXview Power will provide the recovery status in the Recent Event panel and the red triangle will disappear.
