Chapter 1

Overview

Introduction

Welcome to the Moxa RouterOS (MX-ROS) manual. This comprehensive guide is designed to help you understand and navigate the UI features, technical concepts, and tasks you may encounter while using your MX-ROS device. The goal is to simplify your experience and make the setup process easier.

What's in This Document

This document includes the following sections:

- **Overview:** This section introduces this document and how to use it.
- **Quick Start:** This section tells you how to connect to your device so you can start using and configuring it.
- **UI Reference:** This section goes through the web user interface (UI) of your device to help you quickly understand what settings are available. This section also shows you the valid ranges and defaults for settings, and any limitations there may be when configuring your device.
- **Other Features:** This section helps you understand features for your device that may not have a related user interface.
- **Device Applications:** This section goes through various applications and helps you understand the related technologies, product features, and best practices so you can better configure the device for your own needs.
- **Security Hardening Guide:** This section gives you an overview of industrial network security and the related product features and best practices needed to help you better secure your application.
- **Appendix:** This section provides additional reference information for your device.

Who This Document Is For

We want you to get the most out of your Moxa device, so we designed this document

with these audiences in mind:

- **OT engineers learning how to configure OT network devices:** For frontline personnel operating in OT environments, keeping your MX-ROS configuration up-to-date is crucial. We created the **Security** section to help you better understand how you can use this device effectively for your application.
- **Experienced OT network engineers integrating Moxa devices into OT network infrastructure:** For those who already have a solid understanding of networking concepts, the **UI Reference** section is designed to give you a quick reference for all the device settings, options, default settings, and limitations. You may also find the **Security** section useful for learning how to get more out of your Moxa device and to optimize your application.

Supported Series and Firmware Versions

Moxa Router Series	Firmware Version
EDR-8000 Series	v3.6
EDR-G9000 Series	v3.6
TN-4900 Series	v3.6

The information in this document is applicable to other products and firmwares that use MX-ROS V3, but the appearance and availability of features and settings may vary. For more information about which features are supported by each product series, refer to the [Supported Features List](#).

MX-ROS support will expand to other products in the future; please check the [Moxa website](#) for the latest information.

Supported Features List

Support for various features varies depending on the product and model. Refer to the table below for an overview of which features are supported by different product series.

Please note that there may still be some differences in functions between different models within a product series.

Document Conventions

This document uses the following formatting conventions:

Convention/Format	Description
Bold	Used for UI elements you see on-screen, including page name, tab name, field labels, dropdown options, menu path, etc.
Italics	Used to highlight important information in a paragraph or a table, such as indicating that a UI setting is only shown under certain conditions.
Code/commands/CLI	Used for code snippets, blocks, commands, and CLI output.

Chapter 2

Quick Start

Quick Start

This section provides you with information on how to connect to your device to access its configuration interface.

Using a Web Browser to Configure the Industrial Secure Router

The device's web interface provides a convenient way to modify the router's configuration and access the built-in monitoring and network administration functions.

Note

When using the device's web interface, we recommend using the following browsers and versions. Please note that Internet Explorer (IE) is not supported.

- Chrome: 2 most recent versions
- Firefox: Latest version and the Extended Support Release (ESR)
- Edge: 2 most recent major versions
- Safari: 2 most recent major versions
- iOS: 2 most recent major versions
- Android: 2 most recent major versions

Perform the following steps to access the device's web interface:

1. Make sure your PC host is connected to your device's LAN port, and is on the same subnet as your device.
2. Open a web browser and type the device's LAN IP address (**192.168.127.254** by

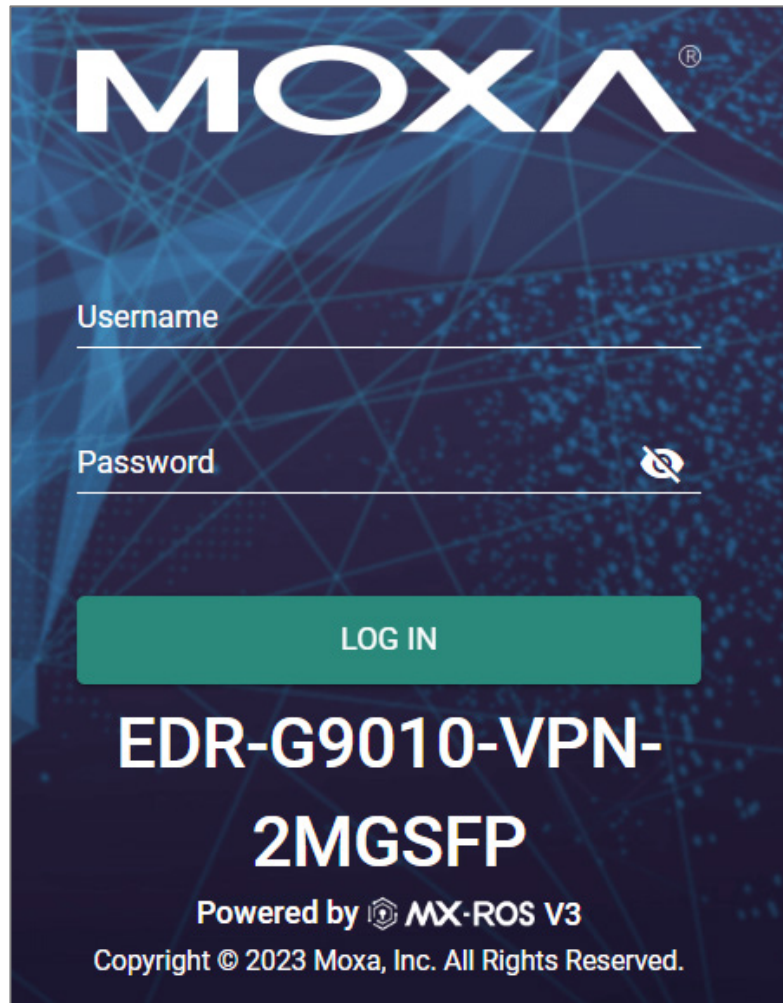

default) into the address bar and press Enter.

3. The web login page will open. Enter the username (**admin** or **user**) and password (the same as the Console password) and click **LOG IN** to continue.

Note

The default username is **admin** and the default password is **moxa**. We strongly recommend changing the password as soon as possible to ensure the security of your device.

You may need to wait a few moments for the web interface to appear. If you have logged in before, a system message will appear showing the details of the last successful login. Click **CLOSE** to close this message.

- After successfully connecting to the router, the **Device Summary** screen will automatically appear. Use the menu tree on the left side of the window to open the function pages to access each of the router's functions.

UI Reference

This section provides you with a quick reference to the different settings and options of your device.

To help you understand how to use the user interface, the following sections are included:

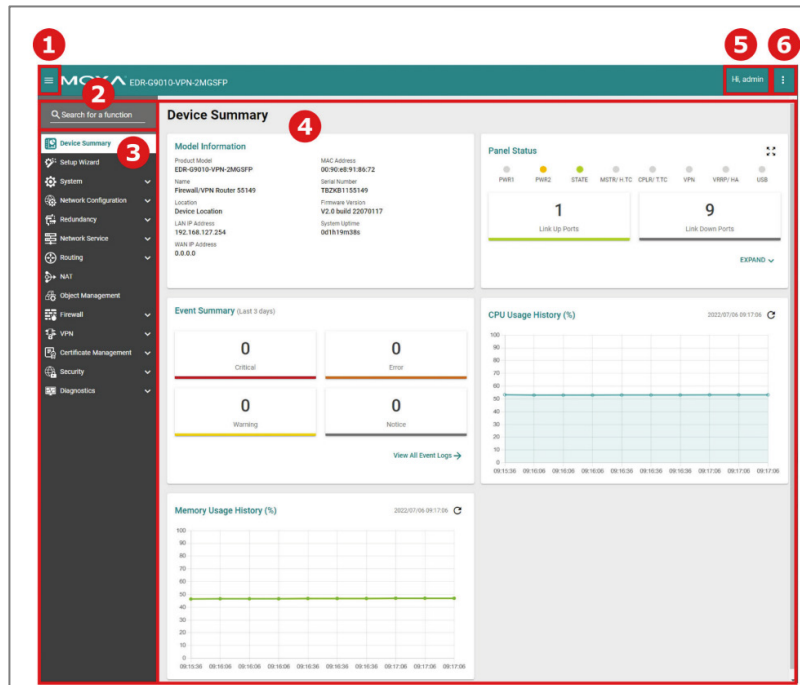

- The MX-NOS User Interface

The rest of this section follows the order of the menu areas in the user interface:

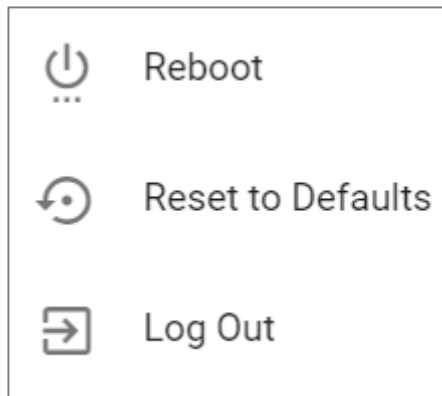

- Device Summary
- Setup Wizard
- System
- Network Configuration
- Redundancy
- Network Service
- Routing
- NAT
- Object Management
- Firewall
- VPN
- Certificate Management
- Security
- Diagnostics
- Industrial Application

The MX-ROS User Interface

Here is an overview of the MX-ROS user interface.

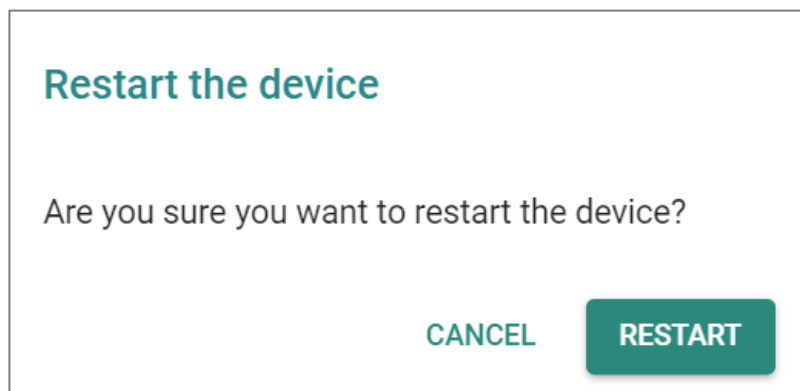

1. Clicking  in the top-left will toggle display of the function menu.
2. Enter the name of a function in the **Search Bar** to quickly find a specific function page.
3. Click on a page name in the **Function Menu** on the left-hand side to go to its function page.
4. All the configuration options and information of the selected function page will be shown here.
5. The name of the currently logged-in user is shown here.
6. Clicking  in the top-right will expand the drop-down menu shown below.

Reboot

Click **RESTART** to reboot your Moxa device.

Reset to Defaults

The Reset to Defaults option gives users a quick way to restore their device's settings back to their factory default values. This function is available in both the console utility (serial or Telnet) and the web browser interface. Click **RESET** to reset your device to the factory default settings.

⚠ Warning

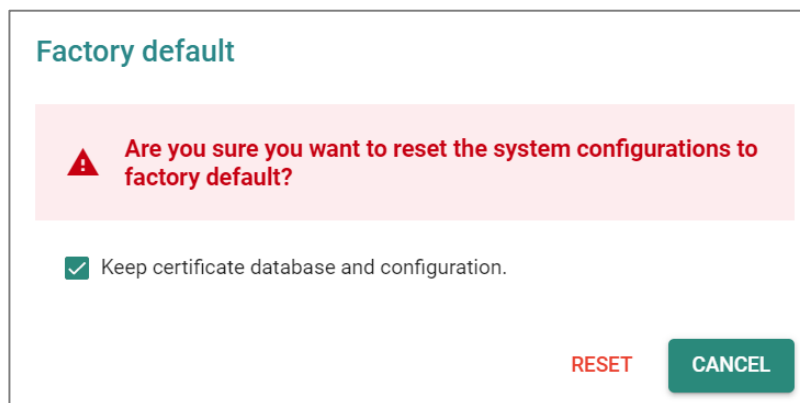

When resetting your device to the factory default settings, all your current configuration settings will be permanently deleted.

Check the **Keep certificate database and configuration** option to keep the certificate database and configuration information. Leaving this option unchecked will **delete all information** on the device and reset everything to its factory default value.

After resetting to default, the Network Security Package will be reset to the built-in version. If you have installed a newer version of the package, remember to reinstall your desired version of the Network Security Package if needed.

After resetting the device, you will need to use the default network settings to re-establish a web-browser or Telnet connection to your Moxa device.

For security reasons, before decommissioning the device, the device should be reset to factory default settings and all stored data should be erased.

Log Out

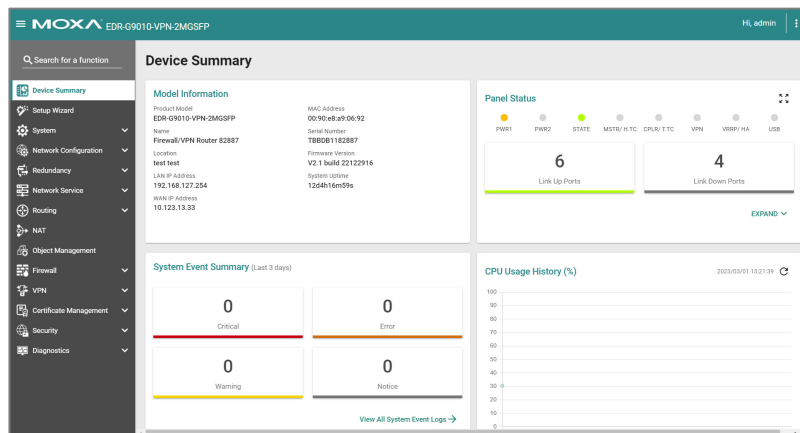

Click **LOG OUT** to log out of your device.

Device Summary

Menu Path: Device Summary

This page lets you see displays with information about your device and current status.

Model Information

This display shows basic information about your device.

Model Information

Product Model	MAC Address
TN-4916-8PoE-4GPoE-4GTX-T	00:90:e8:a9:ed:2b
Name	Serial Number
Firewall/VPN Router 05518	TBBED1105518
Location	Firmware Version
Device Location	V3.0 build 23021713
LAN IP Address	System Uptime
192.168.127.254	18d21h54m15s
WAN IP Address	
10.123.44.123	

UI Setting	Description
Product Model	Shows the product model of the device.
Name	Shows the name of the device. Refer to System > System Management > Information Settings for more information.
Location	Shows the location of the device. Refer to System > System Management > Information Settings for more information.
LAN IP Address	Shows the LAN IP address of the device. This can be configured in the Setup Wizard .
WAN IP Address	Shows the WAN IP address of your device. This can be configured in the Setup Wizard .
MAC Address	Shows the MAC address of your device.
Serial Number	Shows the serial number of your device.
Firmware Version	Shows the firmware version of your device.
System Uptime	Shows the amount of time your device has been continuously running for.

Panel Status

This display shows the status LEDs of your device. For example, connected ports will be shown in green, while disconnected ports will be shown in gray.

Click **EXPAND** to view more detailed information.

The Panel Status widget displays a row of eight status indicators: PWR1 (orange), PWR2 (grey), STATE (green), MSTR/H.TC (grey), CPLR/T.TC (grey), VPN (grey), VRRP/HA (grey), and USB (grey). Below this row are two large boxes: the left one shows '6 Link Up Ports' with a green underline, and the right one shows '4 Link Down Ports' with a grey underline. An 'EXPAND' button with a downward arrow is located at the bottom right.

Click **COLLAPSE** to hide the details.

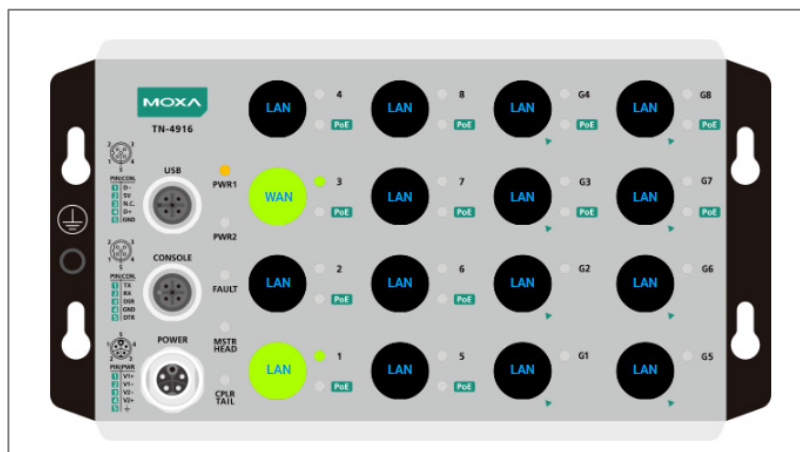

The Panel Status widget is expanded to show a 'Port' section. It lists eight ports: 1 (LAN), 2 (LAN), 3 (LAN), 4 (LAN), 5 (LAN), 6 (LAN), 7 (LAN), and 8 (WAN). The first four ports have green status indicators, while ports 5, 6, 7, and 8 have grey indicators. Below this, two more ports are listed: G1 (LAN) and G2 (LAN), both with grey status indicators. A 'COLLAPSE' button with an upward arrow is located at the bottom right.

Panel View

Clicking the **Expand** (↔) icon in the **Panel Status** display will show your device's port status on a representative image of the device. This image will vary depending on your device. Click the **Close** (X) icon in the upper-right corner to close the **Panel View**.

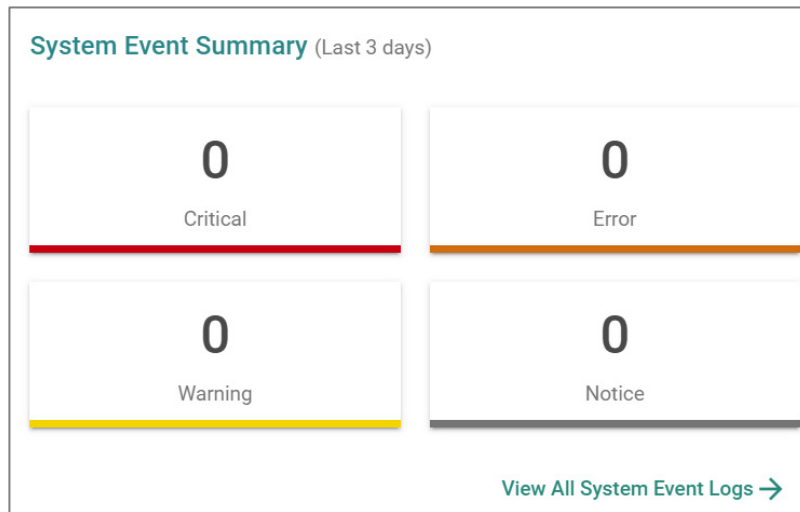

Note

Available LEDs may vary across different versions of devices. For more information about status LEDs and their behavior, refer to [LED Behavior](#).

System Event Summary (Last 3 days)

This display shows the event summary for the past three days.

Click **View All System Event Logs** to go to the Event Log page to view event logs in more detail.

Index	Timestamp	Severity	Additional message
1	2023/8/11 18:40:44+8:00	Informational	Auth Ok, Login Success via UI: Web. Account=admin, Bootup=71, Startup=2d3h41m38s
2	2023/8/11 18:26:7+8:00	Informational	Logout via UI: Web. Account=admin, Bootup=71, Startup=2d3h27m42s
3	2023/8/11 17:43:57+8:00	Informational	Auth Ok, Login Success via UI: Web. Account=admin, Bootup=71, Startup=2d2h45m52s
4	2023/8/11 10:32:15+8:00	Informational	Logout via UI: Serial Console. Account=admin, Bootup=71, Startup=1d19h53m50s

6	2023/8/10 17:14:25+8:00	Informational	Logout via UI: Web. Account=admin, Bootup=71, Startup=1d2h15m59s
7	2023/8/10 17:5:43+8:00	Informational	Auth Ok, Login Success via UI: Web. Account=admin, Bootup=71, Startup=1d2h7m18s

Refer to [Diagnostics > Event Logs and Notifications > Event Log](#) for more information.

CPU Usage History (%)

This display shows the device's CPU usage. The data will be shown as a percentage over

time. Click the **Refresh** (🔄) icon to refresh the graph.

Memory Usage History (%)

This display shows the device's memory usage. The data will be shown as a percentage over time. Click the **Refresh** (🔄) icon to refresh the graph.

Setup Wizard

Menu Path: Setup Wizard

The Setup Wizard helps guide you through basic setup of your device through four steps:

1. Port Type
2. Interface
3. Service
4. Confirm

 **Note**
Available settings will vary depending on your product model.

Port Type

In this step, you can set each port of your device to act as a LAN, WAN, or Bridge port.

UI Setting	Description	Valid Range	Default Value
G1 / G2	Select whether to use this fiber port as a LAN, WAN, or Bridge port.	LAN / WAN / Bridge	LAN
Port 1 / 2 / 3 / 4 / 5 / 6 / 7 / 8	Select whether to use this Ethernet port as a LAN, WAN, or Bridge port.	LAN / WAN / Bridge	LAN

Interface

In this step, you can set up the connection interfaces for your device:

- LAN IP Configuration
- Bridge IP Configuration
- WAN Configuration

Note

Some of these settings may not appear if there are no ports set to **LAN**, **WAN**, or **Bridge**.

The screenshot shows the 'Setup Wizard' interface for a MikroTik device. The wizard is currently on the 'Interface' step, which is highlighted with a green checkmark. The previous step, 'Port Type', is also completed. The 'Service' step is visible but not yet completed. The 'Confirm' step is the final step in the wizard. The 'Interface' step is divided into three sections: 'LAN IP Configuration', 'Bridge IP Configuration', and 'WAN Configuration'. The 'LAN IP Configuration' section shows the IP Address set to 192.168.127.254 and the Subnet Mask set to 24 (255.255.255.0). The 'Bridge IP Configuration' section shows the IP Address set to 192.168.126.254 and the Subnet Mask set to 24 (255.255.255.0). The 'WAN Configuration' section shows the Connect Type set to Dynamic IP. There is also a 'PPTP Dialup' section with a 'PPTP Connection' toggle switch and fields for IP Address, Username, and Password. The 'BACK' and 'NEXT' buttons are visible at the bottom of the screen.

LAN IP Configuration

Set the LAN connection details for your device. If you're not familiar with your LAN interface, seek assistance from the network administrator. Network administrators usually determine the LAN interface configuration.

UI Setting	Description	Valid Range	Default Value
IP Address	Specify the IP address for your LAN port.	Valid IP address	192.168.127.245

 **Note**

The IP Address should be input as unicast IP address.

Subnet Mask	Specify the subnet mask for your LAN port.	Valid subnet mask	255.255.255.0
--------------------	--	-------------------	---------------

WAN IP Configuration

Set the WAN connection details for your device. If you're not familiar with your WAN interface, seek assistance from the network administrator. Network administrators usually determine the WAN interface configuration.

UI Setting	Description	Valid Range	Default Value
Connect Type	Select the connection type to use for your WAN port.	Dynamic IP / Static IP / PPPoE	Dynamic IP

If you choose **Static IP** as your **Connection Type**, these settings will also appear:

UI Setting	Description	Valid Range	Default Value
IP Address	Specify the IP address for your WAN port.	Valid IP address	N/A
Gateway	Specify the gateway for your WAN port.	Valid IP address	N/A
Subnet Mask	Specify the subnet mask for your WAN port.	Valid subnet mask	N/A

PPTP Dialup

Set the PPTP Dialup connection details for your device. This section only appears if **Static IP** or **Dynamic IP** is set for **WAN Configuration > Connect Type**.

 **Note**

Availability of this feature may vary depending on your product model and version.

UI Setting	Description	Valid Range	Default Value
PPTP Connection	Enable or disable using a PPTP connection.	Enabled / Disabled	Disabled
IP Address	Specify the IP address of your PPTP connection.	Valid IP address	N/A
Username	Specify the username for your PPTP connection.	1 to 31 characters	N/A
Password	Specify the password for your PPTP connection.	1 to 31 characters	N/A

PPPoE Dialup

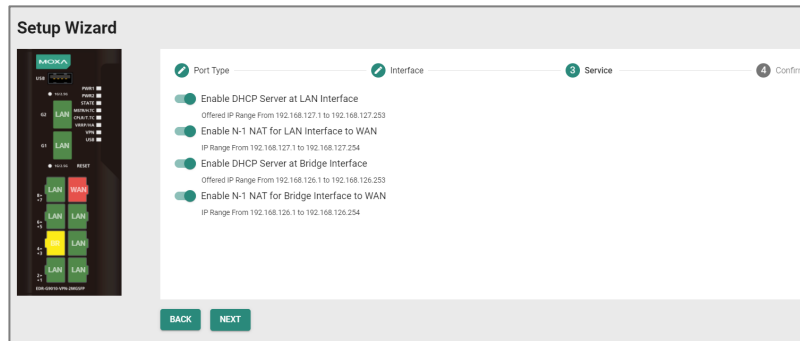

Set the PPPoE Dialup connection details for your device. This section only appears if **PPPoE** is set for **WAN Configuration > Connect Type**.

UI Setting	Description	Valid Range	Default Value
Username	Specify the username for your PPPoE connection.	1 to 31 characters	N/A
Password	Specify the password for your PPTP connection.	1 to 31 characters	N/A
Host Name	Specify the host name for your PPPoE connection.	1 to 31 characters	N/A

Service

In this step, you can enable or disable services for your device.

UI Setting	Description	Valid Range	Default Value
Enable DHCP Server at LAN Interface	Enable or disable using a DHCP server for the LAN interface.	Enable / Disable	Enable
Enable N-1 NAT for LAN Interface to WAN	Enable or disable using N-1 NAT for LAN interfaces to WAN.	Enable / Disable	Enable
Enable DHCP Server at Bridge Interface (if Bridge Mode is Port)	Enable or disable using a DHCP server for bridge interfaces.	Enable / Disable	Enable
Enable N-1 NAT for Bridge Interface to WAN (if Bridge Mode is Port)	Enable or disable using N-1 NAT for bridge interfaces to WAN.	Enable / Disable	Enable

Confirm

Confirm your settings, then click **APPLY** to save and apply your changes.

System

Menu Path: System

The System settings area lets you configure the main system settings for your device.

This settings area includes these sections:

- System Management
- Account Management
- License Management
- Management Interface
- Time
- Power Management
- SMS
- GNSS
- Setting Check

System - User Privileges

Privileges to System settings are granted to the different authority levels as follows. Refer to [System > Account Management > User Accounts](#) for more information on user accounts.

Settings	Admin	Supervisor	User

Power Management	R/W	R/W	R

System Management

Menu Path: System > System Management

This section lets you manage your device's identification, firmware, and configuration backup settings.

This section includes these pages:

- Information Settings
- Firmware Upgrade
- Software Package Management

- Configuration Backup and Restore

Information Settings

Menu Path: System > System Management > Information Settings

This page lets you add additional information about the device to make it easier to identify on the network.

UI Setting	Description	Valid Range	Default Value
Device Name	Enter a name for the device.	1 to 30 characters	Firewall/VPN Router-xxxxx (where xxxxx is the last 5 characters of the device's serial number)
Location	Enter a location for the device.	1 to 80 characters	Device Location
Description	Enter a description for the device.	1 to 40 characters	N/A
Contact Information	Enter the contact information of the person in charge of the device.	1 to 40 characters	N/A

Firmware Upgrade

Menu Path: System > System Management > Firmware Upgrade

This page lets you upgrade the firmware of your device.

You can upgrade the firmware through the following methods:

- Local
- TFTP
- USB
- SCP
- SFTP

It is highly recommended that you back up your device's configuration before upgrading the firmware. Refer to [System > System Management > Configuration Backup and Restore](#) for more information.

If it is necessary to verify the integrity and signature of the application when the system is running, the administrator can use the **show integrity check** CLI command.

Upgrading the firmware should be only be done by qualified personnel, as it is possible to render the device inoperable if the upgrade is not done properly. If you are not familiar with the process, please request the assistance of qualified personnel. You can also consult with Moxa support and we will provide you with the necessary assistance.

Before performing a firmware upgrade, make sure you take the following precautions:

- Back up your configuration before upgrading the firmware
- Ensure that the device has power during the entire process
- Ensure that your computer stays connected to the device you are upgrading the firmware on

- Make sure the connection to the firmware source is not interrupted during the upgrade process

Local

If you select **Local** as your **Method**, these settings will appear. The Local method lets you upload firmware directly from local storage on the host device.

The screenshot shows a web interface titled "Firmware Upgrade". It features a dropdown menu labeled "Method *" with "Local" selected. Below this is a "Select File *" field with a folder icon, and a green "UPGRADE" button.

UI Setting	Description	Valid Range	Default Value
Select File	Navigate to and upload the firmware file from the local host device.	N/A	N/A

TFTP

If you select **TFTP** as your **Method**, these settings will appear. The TFTP method lets you upload and install firmware stored on a remote TFTP server.

The screenshot shows a web form titled "Firmware Upgrade". At the top, there is a dropdown menu labeled "Method" with "TFTP" selected. Below this are two input fields: "Server IP Address *" and "File Name *". At the bottom of the form is a green button labeled "UPGRADE".

UI Setting	Description	Valid Range	Default Value
Server IP Address	Specify the IP address of the TFTP server.	IP address	N/A
File Name	Specify the filename of the firmware file.	File name	N/A

USB

If you select **USB** as your **Method**, these settings will appear. The USB method allows you to install firmware directly from a USB drive attached to your device.

To use this method, **USB Function** must be enabled in **System > Management Interface > Hardware Interface**.

The screenshot shows a web form titled "Firmware Upgrade". At the top, there is a dropdown menu labeled "Method *" with "USB" selected. Below this is a file selection field labeled "Select File *" with a folder icon. At the bottom of the form is a green button labeled "UPGRADE".

UI Setting	Description	Valid Range	Default Value
Select File	Select the firmware file on the USB device.	N/A	N/A

SCP

If you select **SCP** as your **Method**, these settings will appear. The SCP (secure copy protocol) method lets you upload and install firmware from a remote system.

The screenshot shows a 'Firmware Upgrade' form. At the top, the title 'Firmware Upgrade' is displayed. Below it, there is a dropdown menu for 'Method *' with 'SCP' selected. The form contains four input fields: 'Account *' (0 / 31), 'Password *' (0 / 31) with a toggle icon, 'Server IP Address *' (0 / 31), and 'File Name *' (0 / 63). A green 'UPGRADE' button is located at the bottom left of the form.

UI Setting	Description	Valid Range	Default Value
Account	Enter the remote system account name.	1 to 31 characters	N/A
Password	Enter the remote system account password.	1 to 31 characters	N/A
Server IP Address	Specify the IP address of the remote system.	IP address	N/A
File Name	Specify the filename of the firmware file.	1 to 63 characters	N/A

SFTP

If you select **SFTP** as your **Method**, these settings will appear. The SFTP method lets you upload and install firmware stored on a remote SFTP server.

Password	Enter the SFTP server account password.	1 to 31 characters	N/A
Server IP Address	Specify the IP address of the SFTP server.	IP address	N/A
File Name	Specify the filename of the firmware file.	1 to 63 characters	N/A

Software Package Management

Menu Path: System > System Management > Software Package Management

This page lets you upgrade your Network Security Package and MXsecurity Agent Package, enhancing your device's security capabilities. To upgrade a software package, you can either use the package included with the currently installed firmware, or you can download the latest version from the resource section on the Moxa website at www.moxa.com.

Note

Keeping your software packages updated is critical to keep your device and network secure against the latest cyberattacks.

- **Network Security Package:** Helps you protect your device and network with IPS (Intrusion Prevention System) patterns and a DPI (Deep Packet Inspection) engine.

Note

Products that do not support a firewall will not be compatible with the Network Security Package. Most Moxa routers support firewall functionality, except for products with model names that include '-ETBN-' but do not include '-F-', such as the **TN-4908-ETBN-4GTX-4GTXBP-WV-CT-T**.

- **MXsecurity Agent Package:** Provides centralized visibility and security management to streamline management of your device. It helps you monitor and identify cyberthreats, and also helps prevent security misconfigurations to create a robust threat defense.

Network Security Package

UI Setting	Description	Valid Range	Default Value
Source	Select a source to use to upgrade the software package. Local: Use a file stored on the local host. Firmware: Use the package included with the current firmware.	Local / Firmware	N/A

UI Setting	Description	Valid Range	Default Value
Select File (if Local is set for Source)	Select network security package downloaded from Moxa's website. Moxa will periodically release new security packages on the Moxa official website. Users can download the latest security package and then import it into their device.	N/A	N/A
Package Version (if Firmware is set for Source)	Shows the included package version of the current firmware.	N/A	Current Package Version

MXsecurity Agent Package

UI Setting	Description	Valid Range	Default Value
Source	Select a source to use to upgrade the software package. Local: Use a file stored on the local host.	Local / Firmware	N/A
<p>Note</p> <p>The Local option is not commonly used in standard environments. However, if you experience issues with your device and MXsecurity, please reach out to Moxa Technical Support. They can utilize the Local option as a troubleshooting interface.</p> <p>Firmware: Use the package included with the current firmware.</p>			
Select File (if Source is Local)	This is a troubleshooting interface in case you encounter issues with your device and MXsecurity.	N/A	N/A

UI Setting	Description	Valid Range	Default Value

Configuration Backup and Restore

Menu Path: [System > System Management > Configuration Backup and Restore](#)

This page helps you back up and restore your device configuration.

This page includes these tabs:

- Backup
- Restore
- File Encryption

Note

For the TN-4900 Series, configuration files from firmware version v1.2 are not compatible with firmware v3.0 and higher due to substantial changes made between v1.2 and v3.0. Please create and import a new configuration file when changing from firmware v1.2 to v3.0 or higher. If you encounter any issues, please contact Moxa technical support.

Configuration Backup and Restore - Backup

Menu Path: [System > System Management > Configuration Backup and Restore - Backup](#)

This page lets you create a backup of the current device configuration.

There are multiple methods of backing up the device configuration:

- Local
- TFTP
- USB
- SCP
- SFTP

For security reasons, we strongly recommend the administrator to back up the system configuration to a secure storage location periodically.

Local

If you select **Local** as your **Method**, these settings will appear. The Local method will export the configuration backup file to the local host.

The screenshot shows a web interface titled "Configuration Backup and Restore". It has three tabs: "Backup", "Restore", and "File Encryption". The "Backup" tab is active. Below the tabs, there is a "Method" dropdown menu with "Local" selected. A green "BACK UP" button is visible below the dropdown.

TFTP

If you select **TFTP** as your **Method**, these settings will appear. The TFTP method lets you upload the configuration backup file to a remote TFTP server.

Account Management

Menu Path: System > Account Management

This section lets you manage the user accounts used to access the device.

This section includes these pages:

- User Accounts
- Password Policy

User Accounts

Menu Path: System > Account Management > User Accounts

This page allows you create, manage, modify, and remove user accounts.

Note

We strongly recommend changing the default password for the **admin** account after logging in for the first time.

- The default **admin** account cannot be deleted and is enabled by default.
- Only **admin** accounts may change the password for **supervisor** and **user** accounts.
- For security reasons, it is recommended for the administrator to keep a record of the account list and associated users.

Warning

Due to the constraints of the IEC 62443-4-2 integrity verification standard, User Accounts will be reset to Factory Default under certain conditions. Specifically, all non-Factory Default user accounts will be entirely removed by the system when the following conditions are all met:

- The original firmware version of the user device is V.3.0 or higher.
- The user downgrades the firmware below to V.3.0 and performs any action on this firmware.
- The firmware version is subsequently upgraded back to V.3.0 or higher.

In cases where all these conditions are satisfied, all user-created non-factory default accounts will be removed.

However, if a user's original firmware version was below V.3.0 and they later upgrade to V.3.0 or subsequent versions, this issue will not arise.

Limitations

You can create up to 10 user accounts.

	Status	Username	Authority	Password Expire

Adding a New License

Goal

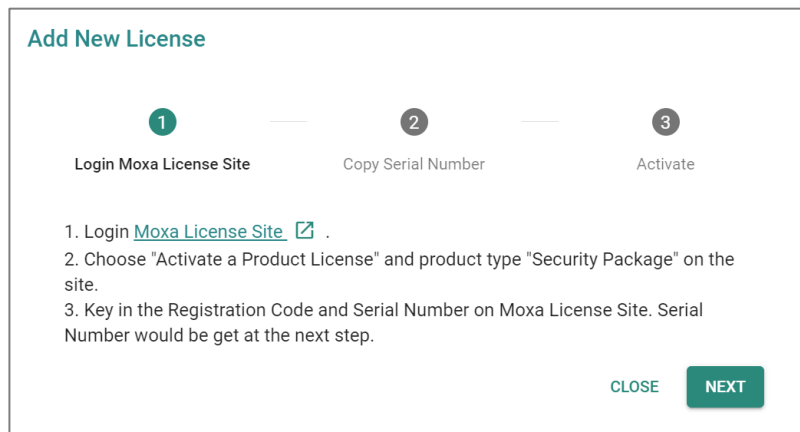

This section provides step-by-step instructions on how to add a new license for your Moxa device.

Prerequisites

- You will need the registration code for your license. You should have received this by email after purchasing the license.

Procedure

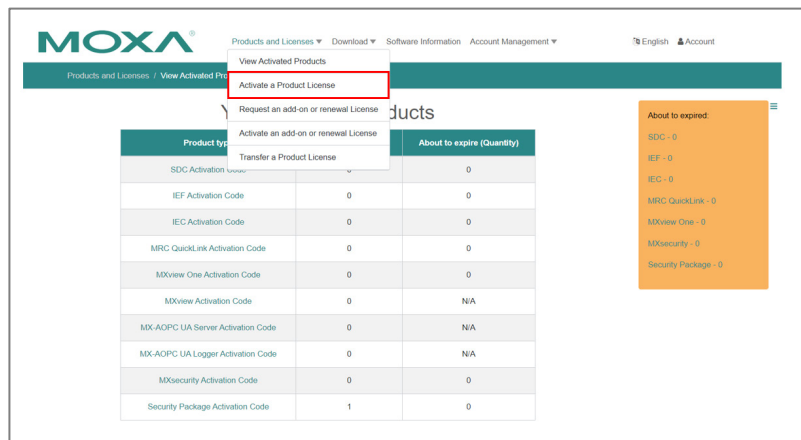

1. In **System > License Management**, click on the **Add New License** button. A new page with instructions will appear.

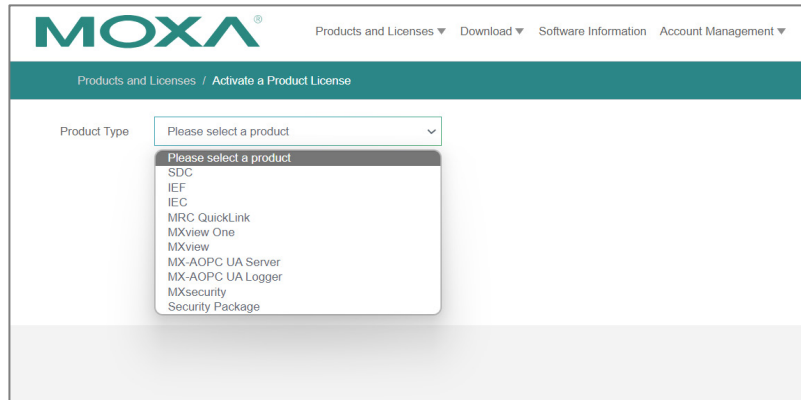

2. Click on the **Moxa License Site** link to open a new browser window for the Moxa Software Licensing site and log in.

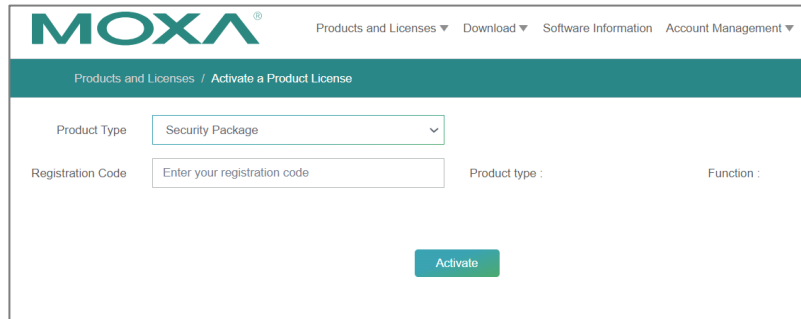

3. Click on the **Products and Licenses** category at the top of the page to expand it, and then select **Activate a Product License**.

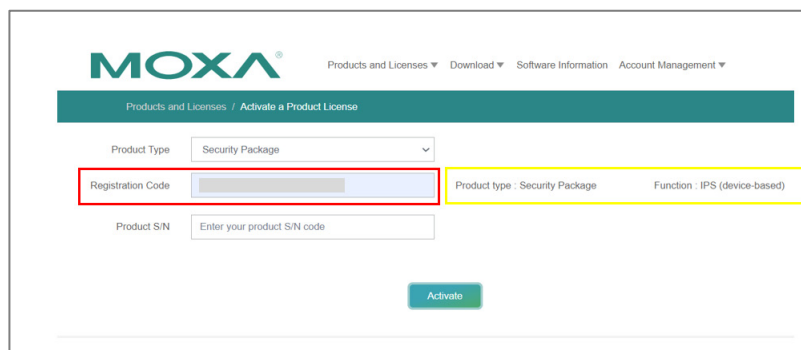

4. Choose the product type for which you want to add a license. In this example, we will be adding a **Security Package**.

5. Enter the **Registration Code** and click **Activate**.

6. Once you click **Activate**, the **Product S/N** (Serial Number) will be displayed, and additional information will appear on the right side of the page.

7. Back in the Add New License window for your Moxa device, click **NEXT**.

Add New License

1. Login [Moxa License Site](#) .
2. Choose "Activate a Product License" and product type "Security Package" on the site.
3. Key in the Registration Code and Serial Number on Moxa License Site. Serial Number would be get at the next step.

CLOSE **NEXT**

8. Copy the serial number from the Moxa device UI window and paste it in the **Product S/N** field in the Software Licensing window, then click **ACTIVATE**.

Add New License

Copy the Serial Number to [Moxa License Site](#).

Serial Number:

Management Interface

Menu Path: System > Management Interface

This section lets you configure the interfaces use to manage the device.

This section includes these pages:

- Out of Band Management
- User Interface
- Hardware Interface
- SNMP
- MXsecurity

Out of Band Management

Menu Path: System > Management Interface > Out of Band Management

This page lets you enable and monitor your device's out of band management port, which segregates traffic from the LAN port to provide a fully isolated and more secure Ethernet connection. This port uses an independent IP address so users can securely

connect and configure devices without interfering with operational traffic.

This page includes these tabs:

- Settings
- Status

Out of Band Management - Settings

Menu Path: System > Management Interface > Out of Band Management - Settings

This page lets you configure your device's out of band management ports IP settings.

IP Address *	Subnet Mask *
192.168.1.1	24 (255.255.255.0) ▾
<input type="button" value="APPLY"/>	

UI Setting	Description	Valid Range	Default Value
IP Address	Specify the IP address to use for the out of band management port.	Valid IP address	192.168.1.1
Subnet Mask	Specify the subnet mask to use for the out of band management port.	Valid subnet mask	24 (255.255.255.0)

Out of Band Management - Status

Menu Path: System > Management Interface > Out of Band Management - Settings

This page lets you view the status of your device's out of band management port.

Out of Band Management Information ↻

Admin Status Enabled	Link Status ---
-------------------------	--------------------

UI Setting	Description
Admin Status	Shows whether the out of band management port is enabled or disabled. Refer to System > Management Interface > Hardware Interface for more information.
Link Status	Shows the link status of the out of band management port.

User Interface

Menu Path: [System](#) > [Management Interface](#) > [User Interface](#)

This page lets you configure which interfaces can be used to access the device.

For security reasons, users should access the device using the secure HTTPS and SSH interfaces.

User Interface

HTTP		TCP Port (HTTP) *
Enabled	▼	20
		80, 1024 - 65535

Time

Menu Path: System > Time

This section lets you configure the system time settings for your device.

This section includes these pages:

- System Time
- NTP/SNTP Server

System Time

Menu Path: System > Time > System Time

This section lets you set up time settings for the device itself.

This page includes these tabs:

- Time
- Time Zone
- NTP Authentication

This device does not include a real-time clock. If there is no NTP/SNTP server on the network or if the device is not connected to the Internet, the Current Time and Current Date must be manually reconfigured after each reboot.

System Time - Time

Menu Path: System > System Time - Time

This page lets you set the system time and date.

You can set your system time using these clock sources:

- Local
- SNTP Time
- NTP Time

Local Time

If you select **Local** as your **Clock Source**, these settings will appear. Local lets you set your device's system time manually, or you can copy the time from your local host by

clicking **SYNC FROM BROWSER**. Click **APPLY** to save your changes.

UI Setting	Description	Valid Range	Default Value
Current Time	This shows the device's current system date, time, and time zone.	N/A	N/A
Date	Specify the date manually in YYYY-MM-DD format.	YYYY-MM-DD	Current date
Time	Specify the time manually in HH:MM AM/PM format.	HH:MM AM/PM	Current time

SNTP Time

If you select **SNTP** as your **Clock Source**, these settings will appear. SNTP allows your device to update its system time from a Simplified Network Time Protocol (SNTP) time server. Click **APPLY** to save your changes.

System Time - NTP Authentication

Menu Path: System > System Time - NTP Authentication

This section describes how to configure NTP Authentication. After creating a key, it will be available for use in the **Time** tab. Click **APPLY** to save your changes.

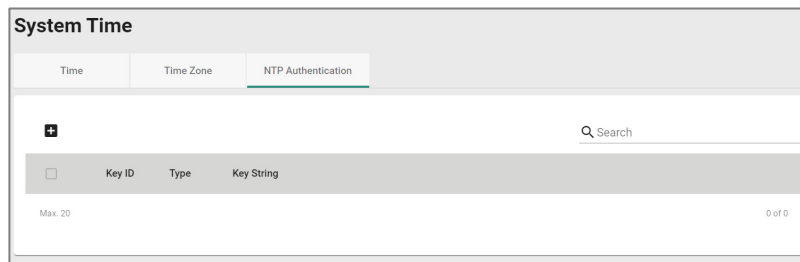

UI Setting	Description
Key ID	Shows the key ID for the authentication key.
Type	Shows the type of NTP authentication the key uses. MD5: Uses authentication based on MD5 algorithms. SHA: Uses authentication based on SHA-512 algorithms.
Key String	Shows the key string used by the authentication key.

Create Entry

Menu Path: System > System Time - NTP Authentication - Create Entry

Clicking the **Add (+)** icon on the **System > System Time - NTP Authentication** page will open this dialog box. This dialog lets you create a new NTP authentication key. Click **CREATE** to save your settings and create the new authentication key.

The 'Create Entry' dialog box contains three input fields: 'Key ID *' with a value of '1 - 65535', 'Type *' which is a dropdown menu, and 'Key String *' with a character count of '0 / 32'. At the bottom right, there are two buttons: 'CANCEL' and 'CREATE'.

UI Setting	Description	Valid Range	Default Value
Key ID	Specify the key ID to use for the authentication key.	1 to 65535 characters	N/A

UI Setting	Description	Valid Range	Default Value
Type	Specify the type of NTP authentication the key should use. MD5: Sets authentication based on MD5 algorithms. SHA: Sets authentication based on SHA-512 algorithms.	MD5 / SHA-512	N/A
Key String	Specify the key string to use for the authentication key.	1 to 32 characters	N/A

Edit Entry

Menu Path: System > System Time - NTP Authentication - Edit Entry

Clicking the **Edit (✎)** icon for a key on the **System > System Time - NTP Authentication** page will open this dialog box. This dialog lets you edit an existing authentication key. Click **APPLY** to save your settings.

All key parameters can be modified, except for the key ID. To modify the key ID, you must create a new authentication key.

Setting Check

Menu Path: System > Setting Check

This page provides a double confirmation mechanism that allows you to verify configuration changes made by remote users before they are applied.

Setting Check is available for the following configuration settings:

- Layer 3 -7 Policy
- Network Address Translate
- Trusted Access

UI Setting	Description	Valid Range	Default Value
Layer 3-7 Policy	Enable or disable Setting Check for Layer 3 - 7 policy changes.	Enabled / Disabled	Disabled
Network Address Translate	Enable or disable Setting Check for NAT policy changes.	Enabled / Disabled	Disabled
Trusted Access	Enable or disable Setting Check for Trusted IP address changes.	Enabled / Disabled	Disabled

UI Setting	Description	Valid Range	Default Value
------------	-------------	-------------	---------------

Timer	Set the time (in seconds) the user has to confirm the changes.	10 to 3600	180
--------------	--	------------	-----

 **Note**

If the user does not confirm the changes within the specified time period, the system will automatically undo the changes.

Network Configuration

Menu Path: Network Configuration

The Network Configuration settings area lets you configure settings related to your device's networking ports.

This settings area includes these sections:

- Ports
- Layer 2 Switching
- Network Interfaces

Network Configuration - User Privileges

Privileges to Network Configuration settings are granted to the different authority levels as follows. Refer to [System > Account Management > User Accounts](#) for more information on user accounts.

Settings	Admin	Supervisor	User
Ports			
Port Settings	R/W	R/W	R
Link Aggregation	R/W	R/W	R

Port Settings - Status

Menu Path: Network Configuration > Ports > Port Settings - Status

This tab lets you monitor the status of each port. Click the **Refresh** (🔄) button to refresh the table.

The screenshot shows a web interface titled "Port Settings" with two tabs: "Setting" and "Status". The "Status" tab is active. Below the tabs is a search bar with a magnifying glass icon and the text "Search". The main content is a table with the following columns: Port, Status, Media Type, Link Status, Description, Flow Control, MDI/MDIX, and Port State. The table contains 12 rows of data.

Port	Status	Media Type	Link Status	Description	Flow Control	MDI/MDIX	Port State
3	Enabled	1000TXRJ45	100M-Full		Off	MDI	Forwarding
4	Enabled	1000TXRJ45	-		-	-	-
5	Enabled	1000TXRJ45	-		-	-	-
6	Enabled	1000TXRJ45	100M-Full		Off	MDI	Forwarding
8	Enabled	1000TXRJ45	1G-Full		Off	MDI	Forwarding
G1	Enabled	N/A	-		-	-	-
G2	Enabled	N/A	-		-	-	-
Tk1	Enabled	-	-		-	-	-
Tk2	Enabled	-	1G-Full		-	-	-

At the bottom right of the table, there is a page indicator: "1 - 9 of 9".

UI Setting

Description

Port	Shows which port this row describes.
Status	Shows the status of the port.
Media Type	Shows the port's media type.
Link Status	Shows the speed and duplex mode the connection is currently using. If the link is not active, a - will be shown.
Description	Shows the description for the port.
Flow Control	Shows the whether flow control is currently on or off for the port. If the link is not active, a - will be shown.
MDI / MDIX	Shows whether the port is using MDI or MDIX for its connection. If the link is not active, a - will be shown.
Port State	Shows the port state for the port. If the link is not active, a - will be shown.

Link Aggregation

Menu Path: Network Configuration > Ports > Link Aggregation

This page lets you configure link aggregation for your device. Link aggregation (or port trunking) is the process of combining multiple physical network links into a single logical link to increase bandwidth, improve redundancy and availability, and provide load balancing across links.

Note

Ports in the same link aggregation must have the same speed.

Note

For TN-4916 models with only 4 Gigabit ports, ports 1 to 8 cannot be aggregated with ports 9-12 due to design limitations.

Create Link Aggregation

Menu Path: Network Configuration > Ports > Link Aggregation - Create Link Aggregation

Clicking the **Add (+)** icon on the **Network Configuration > Ports > Link Aggregation** page will open this dialog box. This dialog lets you create a new link aggregation with member ports.

Create Link Aggregation

If you want to activate new port trunking settings, the all functions related to the trunking ports will be set to default values.

Config Member Port * i

CANCEL CREATE

UI Setting	Description	Valid Range	Default Value
Config Member Port	Select the ports you want to include in the link aggregation group.	Port drop-down menu	N/A

Edit Link Aggregation

Menu Path: Network Configuration > Ports > Link Aggregation - Edit Link Aggregation

Clicking the **Edit (✎)** icon for a link aggregation on the **Network Configuration > Ports > Link Aggregation** page will open this dialog box. This dialog lets you edit an existing link aggregation with member ports.

Edit Port Channel 1 Settings

If you want to activate new port trunking settings, the all functions related to the trunking ports will be set to default values.

PoE PD Failure Check

Menu Path: [Network Configuration > Ports > PoE - PD Failure Check](#)

This tab lets you monitor the status of a powered device (PD) through its IP address. If the PD fails, the switch will not receive a PD response after the defined period, and the authentication process will be restarted. This function is extremely useful for ensuring network reliability and simplifying management.

Copy Config to Ports	<p>Specify which ports you want to copy this configuration to.</p>	Select port(s) from the drop-down list	None

PoE PD Failure Check

Menu Path: [Network Configuration > Ports > PoE - PD Failure Check](#)

This tab lets you monitor the status of a powered device (PD) through its IP address. If the PD fails, the switch will not receive a PD response after the defined period, and the authentication process will be restarted. This function is extremely useful for ensuring network reliability and simplifying management.

UI Setting	Description
Port	Shows which port this row describes.
PoE Supported	Shows whether the port supports PoE.
Enable	Shows whether PD failure checking is enabled or disabled for the port.
Device IP	Shows what IP will be monitored for PD failure checking for the port.
Check Frequency (sec.)	Shows how often PD failure checks will be performed for the port.
No Response Times	Shows how many IP checking cycles will be tried before determining a PD is not responding.
Action	Shows what action will be taken if a PD failure is detected for the port.

PoE - PD Failure Check - Edit Port Settings

Menu Path: Network Configuration > Ports > PoE - PD Failure Check

Clicking the **Edit (✏️)** icon for a port on the **Network Configuration > Ports > PoE - PD Failure Check** page will open this dialog box. This dialog lets you configure the PD failure check settings for each port. Click **APPLY** to save your changes.

PoE - Scheduling

Menu Path: Network Configuration > Ports > PoE - Scheduling

This tab lets you set schedules for each PoE port. Switch to Advanced Mode, click the Scheduling tab, and then click the + icon to create the scheduling settings.

Limitations

You can create up to 20 scheduling rules.

UI Setting	Description
Rule Name	Shows the name for the scheduling rule.
Enable	Shows whether the rule is enabled or disabled.
Start Date	Shows what date the rule will start on.
Schedule Time	Shows the time when the rule will be active.
End Time	Select the end time for the rule.
Apply the rule to port	Shows which ports will use this rule.

PoE - Scheduling - Create Rule

Menu Path: [Network Configuration](#) > [Ports](#) > [PoE - Scheduling](#)

Clicking the **Add (+)** icon on the [Network Configuration](#) > [Ports](#) > [PoE - Scheduling](#) page will open this dialog box. This dialog lets you create a PoE scheduling rule. Click **CREATE** to save your changes and add the new rule.

Create Rule

Rule Name *

Rule *

Repeat Execution *

Apply the rule to the ...

UI Setting	Description	Valid Range	Default Value
Rule Name	Specify a name for the scheduling rule.	1 to 63 characters	None
Enable	Enable or disable the scheduling rule.	Enable / Disable	Disable
Start Date	Specify a start date for the rule.	mm/dd/yyyy	None
Start Time	Specify a start time for the rule.	AM/PM hh/mm	None
End Time	Specify an end time for the rule.	AM/PM hh/mm	None
Repeat Execution	Specify whether to repeat execution of the rule on a daily or weekly basis.	None / Daily / Weekly	None
Apply the rule to port	Specify which ports should use this rule.	Select port(s) from the drop-down list	None

PoE - Status

Menu Path: Network Configuration > Ports > PoE - Status

This tab lets you view the current PoE status of your ports.

The screenshot shows the PoE Status tab with the following data:

Port	PoE Supported	Power Output	Classification	Current (mA)	Voltage (V)	Consumption (W)	Device Type	Configuration suggestion	PD Failure Check Status
1	Yes	Off	Unknown	0	0	0	NIC	Disable PoE power output	Disabled
2	Yes	Off	Unknown	0	0	0	Not present	No suggestion	Disabled
3	Yes	Off	Unknown	0	0	0	Not present	No suggestion	Disabled
4	Yes	Off	Unknown	0	0	0	Not present	No suggestion	Disabled
5	Yes	Off	Unknown	0	0	0	Not present	No suggestion	Disabled
6	Yes	Off	Unknown	0	0	0	Not present	No suggestion	Disabled

Name	Description
Port	Shows the number of the PoE port.
PoE Supported	Shows whether the port supports PoE.
Power Output	Shows whether PoE power output is on or off for the port.
Classification	Shows the PoE power classification of the port. Each PoE power classification has a different maximum power (in watts) by PSE output as follows: <ul style="list-style-type: none"> 0: 15.4 watts 1: 4 watts 2: 7 watts 3: 15.4 watts 4: 30 watts
Current (mA)	Shows the amount of current (in mA) being supplied to the port.
Voltage (V)	Shows the voltage (in V) being used for the port.
Consumption (W)	Shows the power consumption (in W) of the device connected to the port.

Name	Description
Device Type	<p>Shows the device type of the device currently connected to the port.</p> <p>Not Present: There are no active connections to the port.</p> <p>802.3at: An IEEE 802.3at PD is connected to the port.</p> <p>802.3af: An IEEE 802.3af PD is connected to the port.</p> <p>NIC: A NIC is connected to the port.</p> <p>Unknown: An unknown PD is connected to the port.</p> <p>N/A: The PoE function is disabled.</p>
Configuration Suggestion	<p>Shows configuration suggestions based on detected conditions.</p> <p>Disable PoE power output: A NIC or unknown PD was detected; you may want to disable PoE power output for the port.</p> <p>Select Force Mode: A higher/lower resistance or higher capacitance was detected; you may want to select Force Mode for the port.</p> <p>Select high power output: An unknown classification was detected; you may want to select High Power output.</p> <p>Raise the external power supply voltage to greater than 46 VDC: When the external supply voltage is detected at less than 46 V, the system suggests raising the voltage.</p> <p>Enable PoE function for detection: The system suggests enabling the PoE function.</p> <p>Select IEEE 802.3at auto mode: When detecting an IEEE 802.3at PD, the system suggests selecting 802.3at Auto mode.</p> <p>Select IEEE 802.3af auto mode: When detecting an IEEE 802.3af PD, the system suggests selecting 802.3af Auto mode.</p>
PD Failure Check	<p>Shows the results of the last PD failure check, if checking is enabled. Refer to Network Configuration > Ports > PoE - PD Failure Check for more information.</p> <p>Disable: PD failure checking is not enabled for the port.</p> <p>Alive: The port is alive, and passed the last PD failure check.</p> <p>Not Alive: The port is not alive, and failed the last PD failure check.</p>

Link Fault Passthrough

Menu Path: [Network Configuration > Ports > Link Fault Passthrough](#)

This page lets you enable and configure the Link Fault Passthrough function.

Note

When Link Fault Passthrough is enabled, both ports need to be linked up. Otherwise, traffic between LAN ports or access from LAN ports to the device's web console might be shut down.

Note

Available ports may vary depending on the model, and port selection may be fixed for some models.

UI Setting	Description	Valid Range	Default Value
Status	Enable or disable the Link Fault Passthrough function. When enabled, when any of the port links are down, the other port will be shut down.	Enabled / Disabled	Disabled
Port 1	Specify which port to use as Port 1 in the Link Fault Passthrough pair.	Dropdown list of ports	1
Port 2	Specify which port to use as Port 2 in the Link Fault Passthrough pair.	Dropdown list of ports	2

LAN Bypass Gen3

Menu Path: [Network Configuration](#) > [Ports](#) > [LAN Bypass Gen3](#)

This page lets you enable and configure different LAN bypass modes for your device.

System Failure Bypass Configuration

System Failure Bypass Configuration

Mode
 Disabled ▼

UI Setting	Description	Valid Range	Default Value
Mode	<p>Specify which system failure bypass mode to use. When triggered, system failure bypass allows traffic to continue to flow between LAN ports during system failure events, minimizing disruption and maintaining operational integrity.</p> <p>Disabled: Disable system failure bypass. Traffic will not pass between LAN ports during device failure.</p> <p>Shutdown: Enable system failure bypass only when there is a hardware failure, such as a power outage.</p> <p>Shutdown and Halted: Enable bypass function for both hardware failures and software issues, such as the CPU becoming unresponsive.</p>	Disabled / Shutdown / Shutdown and Halted	Shutdown and Halted

System Runtime Bypass Configuration

System Runtime Bypass Configuration

Status
 Disabled ▼

Auto Recovery Time
 5 i

0 - 43200 min.

APPLY

UI Setting	Description	Valid Range	Default Value
Status	Enable/ Disable the system runtime bypass feature. When system runtime bypass is enabled, this will temporarily allow traffic to flow through LAN ports unimpeded, ensuring continuous network operation.	Disabled / Enabled	Disabled
Auto Recovery Time	Specify the number of minutes after which the device will automatically disable system runtime bypass after it is enabled, and will then recover to normal LAN port behavior. If this is set to 0, the device will not exit system runtime bypass after it is enabled.	0 to 43200	5

Layer 2 Switching

Menu Path: Network Configuration > Layer 2 Switching

This section lets you configure the Layer 2 switching settings for your device.

This section includes these pages:

- VLAN
- MAC Address
- QoS
- Rate Limit
- Multicast

VLAN

This page lets you configure global VLAN settings so you can partition your network into separate VLANs.

This page includes these tabs:

- Global
- Settings
- Status

VLAN Settings - Global

Menu Path: Network Configuration > Layer 2 Switching > VLAN - Global

This tab lets you configure the settings for the management VLAN and management port. Click **APPLY** to save your changes.

UI Setting	Description	Valid Range	Default Value
Management VLAN	Specify the management VLAN ID from the drop-down menu.	1 to 4093	1
Management Port	Specify a management port for this device to allow for quick and easy configuration of VLAN settings for multiple ports.	<i>(Depends on your device model)</i>	N/A

The following settings will appear after selecting a **Management Port**:

UI Setting	Description	Valid Range	Default Value
Mode	Specify which VLAN mode the port should use: Access: Define the port as an Access port. This is used when connecting to single devices without tags. Trunk: Define the port as a Trunk port. This is used when connecting to another 802.1Q VLAN-aware router. Hybrid: Define the port as a Hybrid port. This is used when connecting to another 802.1Q VLAN-aware router, or another LAN that combines tagged and/or untagged devices and/or other routers or hubs.	Access / Trunk / Hybrid	Access
PVID	Set the default VLAN ID to use for traffic from untagged devices that connect to the port.	1 to 4093	1
Tagged VLAN	If the Mode is set to Trunk or Hybrid , you can specify what VLAN IDs tagged devices that connect to the port will use. Use commas to separate different VLANs.	All Member VLANs / 1 to 4093	Access mode: N/A Trunk or Hybrid mode: 1
Untagged VLAN	If the Mode is set to Access , assign a VLAN ID for untagged devices that connect to the port and remove tags upon egress. Use commas to separate different VLAN IDs.	All Member VLANs / 1 to 4093	Access mode: 1 Trunk or Hybrid mode: N/A

VLAN - Settings

Menu Path: Network Configuration > Layer 2 Switching > VLAN - Settings

This tab lets you configure management VLAN and port settings. Click **APPLY** to save your changes.

Limitations

You can create up to 32 VLANs.

8	2	00:90:e8:5d:5f:11	Learnt Unicast	8
9	2	00:90:e8:5d:5f:12	Learnt Unicast	8

UI Setting	Description	Valid Range	Default Value
Aging Time	Specify the aging time for MAC address entries in seconds. The aging time determines how long entries will be kept in the MAC address table in the device's memory before expiring.	5 to 300	300

The MAC address table shows the following information:

UI Setting	Description
Index	Shows the index number of the MAC address.
VLAN ID	Shows which VLAN ID is being used for the MAC address.
MAC Address	Shows the MAC address.
Type	Shows what kind of MAC address entry this is: Learnt Unicast: Used for all learnt unicast MAC addresses. Learnt Multicast: Used for all learnt multicast MAC addresses. Static Unicast: Used for all static unicast MAC addresses. Static Multicast: Used for all static multicast MAC addresses.
Port	Shows which port on the device the MAC address is connected to.

QoS

Menu Path: [Network Configuration](#) > [Layer 2 Switching](#) > [QoS](#)

This page lets you configure QoS settings to control network traffic prioritization.

This page includes these tabs:

- CoS Mapping
- DSCP Mapping
- Port Classification

CoS Mapping

Menu Path: [Network Configuration](#) > [Layer 2 Switching](#) > [QoS - CoS Mapping](#)

This tab lets you configure CoS Mapping, which allows you to map 802.1p/1Q Layer 2 CoS tags to priority queues on the device.

QoS		
CoS Mapping	DSCP Mapping	Port Classification
CoS	Priority Queue	
 0	0

Port Classification

Menu Path: Network Configuration > Layer 2 Switching > QoS - Port Classification

This tab lets you set up QoS queueing mechanisms.

Note

For TN-4900 Series 16-port models, port priority must be handled in 2 separate groups as follows, due to design limitations:

- Ports 1 to 8
 - Ports G1 to G8
- or
- Ports 9 to 12 and G1 to G4
(depends on your model)

UI Setting	Description	Valid Range	Default Value
Scheduling Mechanism	<p>Specify the scheduling mechanism to use for your device:</p> <p>Weight Fair(8:4:2:1): In the weight fair scheme, an 8, 4, 2, 1 weighting is applied to the four priority levels on the device. This approach prevents lower priority frames from being starved of opportunities for transmission with only a slight delay to higher priority frames.</p> <p>Strict(High Priority First Always): In the strict-priority scheme, all top-priority frames egress a port until that priority's queue is empty, and then the next lower priority queue's frames egress. This approach can cause the lower priorities to be starved of opportunities for transmitting any frames, but ensures that all high priority frames will egress the switch as soon as possible.</p>	Weight Fair(8:4:2:1) / Strict(High Priority First Always)	Weight Fair(8:4:2:1)

The port classification table shows the following information:

UI Setting	Description
Port	Shows which port this row describes.
Inspect ToS	Shows whether ToS is enabled or disabled for the port.
Inspect CoS	Shows whether CoS inspection is enabled or disabled for the port.
Priority	Shows the priority for the port. Higher numbers indicate higher priority.

Port Classification - Edit Port Setting

Menu Path: Network Configuration > Layer 2 Switching > QoS - Port Classification

Clicking the **Edit** (↗) icon for a port on the **Network Configuration > Layer 2 Switching > QoS - Port Classification** page will open this dialog box. This dialog lets you adjust the QoS classification settings for each port. Click **APPLY** to save your changes.

UI Setting	Description	Valid Range	Default Value
Ingress	Select the ingress rate limit (% of max. throughput) for all packets.	Not Limited / 3% / 5% / 10% / 15% / 25% / 35% / 50% / 65% / 85%	Not Limited
Egress	Select the egress rate limit (% of max. throughput) for all packets.	Not Limited / 3% / 5% / 10% / 15% / 25% / 35% / 50% / 65% / 85%	Not Limited

Multicast

Menu Path: Network Configuration > Layer 2 Switching > Multicast

This section lets you adjust various settings for handling multicast traffic.

This section includes these pages:

- IGMP Snooping
- Static Multicast Table

IGMP Snooping

Menu Path: Network Configuration > Layer 2 Switching > Multicast > IGMP Snooping

This page lets you configure IGMP snooping, which enables intelligent forwarding of multicast traffic in local area networks (LANs). By listening to IGMP messages sent between hosts and multicast routers, IGMP snooping can learn which multicast groups are active on the network and maintain a database of multicast group membership.

This page includes these tabs:

- VLAN Settings
- Group Table
- Forwarding Table

IGMP Snooping

VLAN Settings Group Table Forwarding Table

UI Setting	Description	Valid Range	Default Value
IGMP Snooping	Enable or disable IGMP Snooping function for the VLAN.	Enabled / Disabled	Disabled
Version	Specify which version of IGMP snooping to use: V1/V2: Enable the Moxa device to send IGMP snooping version 1 and 2 queries. V3: Enable the Moxa device to send IGMP snooping version 3 queries.	V1/V2 / V3	V1/V2

UI Setting	Description	Valid Range	Default Value
------------	-------------	-------------	---------------

Static Router Port	Select which ports will be used to connect to multicast routers for IGMP Snooping. The device will receive all multicast packets from the selected ports.	1/1 / 1/2 / 1/3 / 1/4 / 1/5 / 1/6 / 1/7 / 1/8 / 1/9 / 1/10	N/A
---------------------------	---	--	-----

Note

If a router or Layer 3 switch is connected to the network, it will act as the querier, and the querier function will be disabled on all Moxa Layer 2 switches.

If all switches on the network are Moxa Layer 2 switches, then only one Layer 2 switch will act as the querier.

Group Table

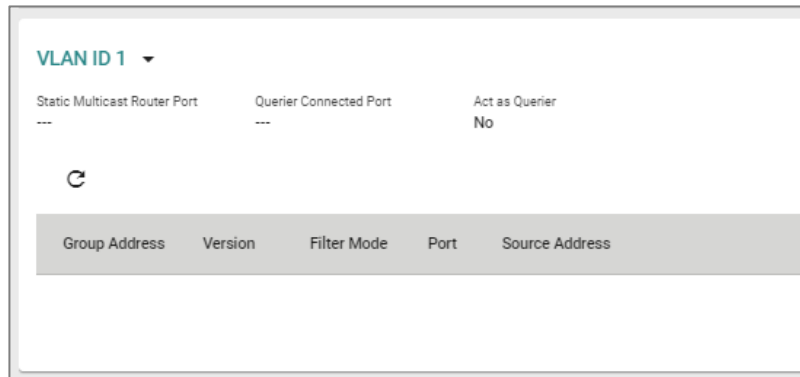

Menu Path: Network Configuration > Layer 2 Switching > Multicast > IGMP Snooping - Group Table

This tab lets you see all currently active IGMP groups that were detected for each VLAN.

VLAN Group Table List

You can use the VLAN drop-down to select which VLAN's group table is displayed.

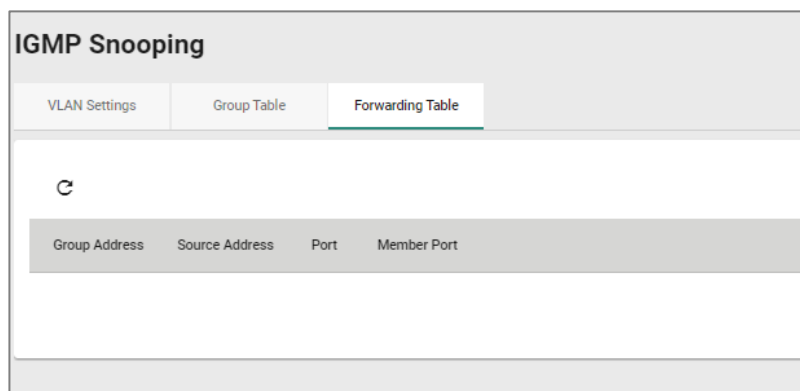

UI Setting	Description
Static Multicast Router Port	Shows the static multicast querier port(s) for the VLAN.
Querier Connected Port	Shows the port which is connected to the querier for the VLAN.
Act as a Querier	Shows whether or not this VLAN has been selected to act as a querier.
Group Address	Shows the multicast group addresses for the VLAN.
Version	Shows the IGMP snooping version for the group address.
Filter Mode	If IGMP v3 is enabled for the VLAN ID, this shows whether the group address is Included or Excluded.
Port	Shows which ports are members of the group address.
Source Address	When IGMP v3 is enabled, this shows the multicast source address for the group address.

Forwarding Table

Menu Path: Network Configuration > Layer 2 Switching > Multicast > IGMP Snooping - Forwarding Table

This page lets you see the multicast stream forwarding status for each VLAN.

UI Setting	Description
Group Address	Shows the multicast group IP address.
Source Address	Shows the IP address the multicast group will receive multicast streams from.
Port	Shows the port receiving the multicast stream.
Member Port	Shows the port the multicast stream is forwarded to.

Static Multicast Table

Menu Path: Network Configuration > Layer 2 Switching > Multicast > Static Multicast Table

This page lets you manage your device's static multicast entries.

Note

Please note that settings and available options will vary depending on the product model.

Note

Moxa's Router Series devices manage MAC address learning for VLANs using IVL (Independent VLAN Learning), which uses separate MAC address tables for each VLAN so that MAC address learning for different VLANs do not interfere with each other. This allows the same MAC address to be used in multiple VLANs without causing forwarding issues.

This may lead to a larger MAC address table size, as each VLAN maintains its own individual address table, and the number of MAC address entries will increase based on the number of VLAN member ports used.

Limitations

You can create up to 256 static multicast entries, though some models may support up to 1000 static multicast entries.

The number of entries is calculated as follows: **Number of MAC address entries * Number of VLAN IDs**

For example, if the static multicast table contains 30 MAC addresses and is connected to 4 VLAN IDs, then the number of MAC address entries would be *30 MAC addresses * 4 VLAN IDs = 120 static multicast entries*.

Static Multicast Table			
	VLAN ID	MAC Address	Port
<input type="checkbox"/>	1	01:00:5e:01:02:03	8
<input type="checkbox"/>	1	01:00:5e:7f:ff:ff	
<input type="checkbox"/>	1	01:00:5e:7f:ff:ff	3

UI Setting	Description
VLAN ID	Shows the VLAN ID used for the static multicast entry.
MAC Address	Shows the MAC address used for the static multicast entry.
Port	Shows which ports are included for the static multicast entry.

Static Multicast Table - Create Static Multicast

Menu Path: Network Configuration > Layer 2 Switching > Multicast > Static Multicast Table

Clicking the **Add (+)** icon on the **Network Configuration > Layer 2 Switching > Multicast > Static Multicast Table** page will open this dialog box. This dialog lets you add a static multicast entry. Click **CREATE** to save your changes and add the new static multicast entry.

Note
 01:00:5E:XX:XX:XX on this page is the IP multicast MAC address, please activate IGMP Snooping for automatic classification.

WAN

Menu Path: Network Configuration > Network Interfaces - WAN

This page lets you configure the settings for the WAN interfaces of your device. WAN interface is VLAN-based; when WAN is enabled for a VLAN ID, all ports associated with that VLAN ID will act as a single WAN interface.

There are multiple types of WAN you can select for your **Connection Type**:

- Static IP
- Dynamic IP
- PPPoE

Static IP

If you select **Static IP** as your **Connection Type**, these settings will appear.

Bridge

Menu Path: [Network Configuration](#) > [Network Interfaces - Bridge](#)

This page lets you configure a bridge for your device.

You can set up these kinds of bridges:

- Port-based
- Zone-based

Port-Based

If you select **Port-Based** as your **Bridge Type**, these settings will appear. Port-based bridges allow the device's firewall to filter traffic moving between bridge member ports.

Bridge IP Configuration

Bridge Type

Port-Based Zone-Based

UI Setting	Description	Valid Range	Default Value
Bridge Type	Select which bridge type you want to use.	Port-Based / Zone-Based	N/A
Name	Specify a name for the bridge.	1 to 12 characters	BRG_LAN
Status	Enable or disable the bridge.	Enabled / Disabled	Disabled
IP Address	Specify an IP address for the bridge.	Valid IP address	192.168.126.254
Subnet Mask	Specify a subnet mask for the bridge.	Valid subnet mask	24(255.255.255.0)
Bridge Member	Select which ports will be members of the bridge.	Drop-down list of ports	N/A

Zone-Based

If you select **Zone-Based** as your **Bridge Type**, these settings will appear. Zone-based bridges allow you to create zones based on VLANs. The device's firewall can then filter traffic moving between all ports in a zone.

Limitations

You can create up to 4 different bridge zones.

0 / 12

APPLY

UI Setting	Description	Valid Range	Default Value
Bridge Type	Select which bridge type you want to use.	Port-Based / Zone-Based	N/A
Name	Specify a name for the bridge.	1 to 12 characters	ZONE_BRG
Status	Enable or disable the bridge.	Enabled / Disabled	Disabled
IP Address	Specify an IP address for the bridge.	Valid IP address	0.0.0.0
Subnet Mask	Specify a subnet mask for the bridge.	Valid subnet mask	0 (0.0.0.0)

Each zone has the following settings:

UI Setting	Description	Valid Range	Default Value
Name	Specify a name for the bridge zone.	1 to 12 characters	N/A
Bridge Member	Select which VLAN will determine the members of this zone.	Drop-down list of VLANs	N/A

MTU Configuration

Menu Path: Network Configuration > Network Interfaces - MTU

This page lets you configure the MTU settings for your interfaces.

Network Interfaces									
LAN		WAN		Bridge		MTU Configuration		Secondary IP	
Name	MTU	PRP Traffic							
WAN	1500	--							
LAN	1500	--							
lan2	1500	--							
Max. 16									

UI Setting	Description
Name	Shows the name of the interface.
MTU	Shows the MTU size used for the interface.
PRP Traffic	Shows the PRP traffic status for the interface.

MTU Configuration - Edit MTU Entry

Menu Path: [Network Configuration](#) > [Network Interfaces - MTU Configuration](#)

Clicking the **Edit** (✎) icon for an interface on the **Network Configuration > Network Interfaces - MTU Configuration** page will open this dialog box. This dialog lets you edit the MTU settings for an interface. Click **APPLY** to save your changes.

UI Setting	Description	Valid Range	Default Value
Name	Shows the name of of this interface. This setting cannot be changed here.	N/A	Name of interface
MTU	Specify the MTU size to use for the interface.	68 to 1578	1500

Note

Jumbo Frames are not currently supported.

Secondary IP

Menu Path: Network Configuration > Network Interfaces - Secondary IP

This page lets you create secondary IPs for your interfaces. The Layer 3 interface can act as a secondary IP for a network interface, allowing a single interface to communicate with multiple networks, increasing network flexibility and availability.

Secondary IP - Create Secondary IP Entry

Menu Path: Network Configuration > Network Interfaces - Secondary IP

Clicking the **Add (+)** icon on the **Network Configuration > Network Interfaces - Secondary IP** page will open this dialog box. This dialog lets you create a secondary IP for an interface. Click **CREATE** to save your changes and add the new secondary IP.

Limitations

You can create up to 640 secondary IPs.

The dialog box titled "Create Secondary IP Entry" contains the following fields and buttons:

- Interface ***: A dropdown menu.
- IP Address ***: A text input field.
- Netmask ***: A dropdown menu.
- CANCEL**: A text button.
- CREATE**: A green button.

UI Setting	Description	Valid Range	Default Value
Interface	Select which interface the secondary IP is for.	Drop-down list of interfaces	N/A
IP Address	Specify the IP address of the secondary interface.	Valid IP address	N/A
Netmask	Specify the subnet mask of the secondary interface.	Valid netmask	N/A

Secondary IP - Edit Secondary IP Entry

Menu Path: Network Configuration > Network Interfaces - Secondary IP

Clicking the **Edit** (✎) icon on the **Network Configuration > Network Interfaces - LAN** page will open this dialog box. This dialog lets you edit an existing secondary IP entry. Click **SAVE** to save your changes.

Edit Secondary IP Entry

Delete Secondary IP

Menu Path: Network Configuration > Network Interfaces - Secondary IP

You can delete secondary IP entries by using the checkboxes to select the entries you want to delete, then clicking the **Delete (🗑)** icon.

Redundancy

Menu Path: Redundancy

The Redundancy settings area lets you configure redundancy settings to help you ensure network availability.

This settings area includes these sections:

- Layer 2 Redundancy
- Layer 3 Redundancy
- VRRP

Redundancy - User Privileges

Privileges to Redundancy settings are granted to the different authority levels as follows. Refer to [System > Account Management > User Accounts](#) for more information on user accounts.

Settings	Admin	Supervisor	User
Layer 2 Redundancy			
Spanning Tree	R/W	R/W	R
Turbo Ring V2	R/W	R/W	R
Layer 3 Redundancy			
VRRP	R/W	R/W	R

Layer 2 Redundancy

Menu Path: Redundancy > Layer 2 Redundancy

This section lets you manage various Layer 2 redundancy features for your device.

This section includes these pages:

- Spanning Tree
- Turbo Ring V2
- Turbo Chain

Spanning Tree

Menu Path: Redundancy > Layer 2 Redundancy > Spanning Tree

This page lets you configure Spanning Tree Protocol (STP) settings for redundancy.

This page includes these tabs:

- General
- Status

Note

Spanning Tree can only run on the Management VLAN.

Spanning Tree - General

Menu Path: [Redundancy](#) > [Layer 2 Redundancy](#) > [Spanning Tree - General](#)

This page lets you configure spanning tree settings for your device.

Spanning Tree Settings

Port	Status	Edge	Priority	Path Cost
3	Disabled	False	128	20000
4	Disabled	False	128	20000
5	Disabled	False	128	20000
6	Disabled	False	128	20000
8	Disabled	False	128	20000
G1	Disabled	False	128	20000
G2	Disabled	False	128	20000

UI Setting	Description	Valid Range	Default Value
Status	Enable or disable Spanning Tree Protocol for the device.	Enabled / Disabled	Enabled

UI Setting	Description	Valid Range	Default Value
Bridge Priority	Specify the bridge priority. Lower numbers represent higher priority. A device with a higher bridge priority has a greater chance of being established as the root of the spanning tree topology.	0 to 61440, in multiples of 4096	32768
Forward Delay Time	Specify the forwarding delay time. This is the amount of time this device will wait before checking to see if it should change to a different state.	4 to 30 seconds	15
Hello Time	Specify the interval at which the device, if it is currently the root of the spanning tree topology, will send out periodic "Hello" messages to other devices on the network to check if the topology is healthy.	1 to 2 seconds	2
Max Age	Specify the maximum age duration to wait for a "Hello" message from the root of the spanning tree topology before the device will reconfigure itself as root. If two or more devices on the network are recognized as a root, the devices will negotiate to determine which will act as the new root.	6 to 40 seconds	20

Spanning Tree List

Note

We recommend that you disable Spanning Tree Protocol on a port if it is connected to a device (such as a PLC or RTU) instead of network equipment, as this may cause unnecessary negotiation.

Port	Status	Edge	Priority	Path Cost
3	Disabled	False	128	20000
4	Disabled	False	128	20000
5	Disabled	False	128	20000
6	Disabled	False	128	20000
8	Disabled	False	128	20000
G1	Disabled	False	128	20000
G2	Disabled	False	128	20000

UI Setting	Description
Port	Shows the port number.
Status	Shows the status of the port as a node in the spanning tree topology.
Edge	Shows whether the port is an edge port or not. Force Edge: The port is fixed as an edge port and will always be in the forwarding state. False: The port is not an edge port.
Priority	Shows the priority of the port. Lower numbers indicate higher priority.
Path Cost	Shows the path cost for the port. Higher path costs indicate that this port is less suitable as a node for the spanning tree topology. If set to 0, the path cost will be automatically calculated based on different port speeds.

Spanning Tree - Edit Port Settings

Menu Path: Redundancy > Layer 2 Redundancy > Spanning Tree - General

Clicking the **Edit (✎)** icon for an port on the **Redundancy > Layer 2 Redundancy > Spanning Tree - General** page will open this dialog box. This dialog lets you configure the spanning tree settings for a port. Click **APPLY** to save your changes.

Spanning Tree - Status

Menu Path: [Redundancy](#) > [Layer 2 Redundancy](#) > [Spanning Tree - Status](#)

This page lets you see the current spanning tree status of your device and its ports.

Root Information

The screenshot shows the 'Spanning Tree' configuration page with the 'Status' tab selected. Under 'Root Information', the 'Root State' is shown as '---'. Below this is a table with columns: Port, Status, Edge, Priority, Path Cost, and Port State. The table lists several ports (3, 4, 5, 6, 8, G1, G2) all with a status of 'Disabled', Edge set to 'False', Priority of '128', and Path Cost of '20000'. The Port State for all listed ports is '---'. A search bar is visible above the table, and a page indicator '1 - 7 of 7' is at the bottom right.

Port	Status	Edge	Priority	Path Cost	Port State
3	Disabled	False	128	20000	---
4	Disabled	False	128	20000	---
5	Disabled	False	128	20000	---
6	Disabled	False	128	20000	---
8	Disabled	False	128	20000	---
G1	Disabled	False	128	20000	---
G2	Disabled	False	128	20000	---

UI Setting	Description
------------	-------------

Root State	Shows whether the device is currently acting as the root of the spanning tree topology.
-------------------	---

Spanning Tree Port List

The screenshot shows the 'Spanning Tree' configuration page with the 'Status' tab selected. It displays 'Root Information' and a table of port settings. The table has columns for Port, Status, Edge, Priority, Path Cost, and Port State. The data rows are as follows:

Port	Status	Edge	Priority	Path Cost	Port State
3	Disabled	False	128	20000	—
4	Disabled	False	128	20000	—
5	Disabled	False	128	20000	—
6	Disabled	False	128	20000	—
8	Disabled	False	128	20000	—
G1	Disabled	False	128	20000	—
G2	Disabled	False	128	20000	—

UI Setting	Description
------------	-------------

Port	Shows the port number.
-------------	------------------------

Enable	Shows whether Spanning Tree Protocol is enabled for the port.
---------------	---

Edge	Shows whether the port is an edge port or not.
-------------	--

Force Edge: The port is fixed as an edge port and will always be in the forwarding state.

True: The port is currently designated as an edge port.

False: The port is not an edge port.

Priority	Shows the priority of the port. Lower numbers indicate higher priority.
-----------------	---

Path Cost	Shows the path cost for the port. Higher path costs indicate that this port is less suitable as a node for the spanning tree topology.
------------------	--

If set to 0, the path cost will be automatically calculated based on different port speeds.

Port State	Shows the current spanning tree status of the port.
-------------------	---

Forwarding: Indicates the port is allowing transmissions normally.

Blocking: Indicates the port is blocking transmissions.

Turbo Ring V2

This page lets you manage the Turbo Ring V2 redundancy feature for your device.

This page includes these tabs:

- General
- Status

Note

Turbo Ring V2 can only run on the Management VLAN.

Turbo Ring V2 - General

Menu Path: Redundancy > Layer 2 Redundancy > Turbo Ring V2 - General

This page lets you configure the Turbo Ring settings for your device.

Turbo Ring Settings

UI Setting	Description	Valid Range	Default Value
Status	Enable or disable Turbo Ring V2 for the device.	Enabled / Disabled	Disabled

Ring Settings

Note

To set up a Dual-Ring architecture, you must enable both Ring 1 and Ring 2.

Ring ID	Status	Master	Ring Port 1	Ring Port 2
Ring 1	Disabled	Enabled	--	8
Ring 2	Enabled	Enabled	6	4

UI Setting

Description

Ring ID	Shows the ring ID.
Status	Shows the status of the ring.
Master	Shows whether this device is designated as the master for the ring.
Ring Port 1	Shows which port will act as ring port 1. If this device is designated as the master for the ring, this will be the primary ring connection.
Ring Port 2	Shows which port will act as ring port 2. If this device is designated as the master for the ring, this will be the backup ring connection, and will be blocked normally.

Turbo Ring V2 - Ring Settings

Menu Path: Redundancy > Layer 2 Redundancy > Turbo Ring V2 - General

Clicking the **Edit (✎)** icon for a ring on the **Redundancy > Layer 2 Redundancy > Turbo Ring V2 - General** page will open this dialog box. This dialog lets you adjust your device's settings for the ring. Click **APPLY** to save your changes.

Layer 3 Redundancy

Menu Path: [Redundancy](#) > [Layer 3 Redundancy](#)

This section lets you configure the Layer 3 redundancy features of your device.

This section includes these pages:

- [VRRP](#)

VRRP

Menu Path: [Redundancy](#) > [Layer 3 Redundancy](#) > [VRRP](#)

This page lets you configure the VRRP settings for your device.

This page includes these tabs:

- [Settings](#)
- [Status](#)

VRRP - Settings

Menu Path: [Redundancy](#) > [Layer 3 Redundancy](#) > [VRRP - Settings](#)

This page lets you configure the VRRP settings for your device.

Virtual Router Redundancy Protocol (VRRP) helps solve some problems with static configurations. VRRP enables a group of routers to form a single virtual router with a virtual IP address. The LAN clients can then be configured with the virtual router’s virtual IP address as their default gateway. This virtual router consisting of a group of routers is also known as a VRRP group.

Limitations

You can create up to 16 virtual routers.

VRRP Settings

UI Setting	Description	Valid Range	Default Value
VRRP	Enable or disable VRRP for the device.	Enabled / Disabled	Disabled
Version	Select the VRRP version to use.	Version 2 / Version 3	Version 3

VRRP List

UI Setting	Description
Status	Shows the status of the VRRP interface.
Index	Shows the index number used to identify the VRRP interface.
Interface	Shows which network interface is used for the VRRP interface.
IP Address	Shows the IP address of the VRRP interface.
VIP	Shows the virtual router IP address for the VRRP interface.
VRID	Shows the virtual router ID for the VRRP interface, which is used to assign the virtual router to a VRRP group.
Prio.	Shows the priority of the VRRP interface. Higher numbers indicate higher priority, with 254 being the highest.
Adv int(ms)	Shows the advertisement interval for the VRRP interface in milliseconds.
Preemption	Shows the preemption status of the VRRP interface.
Accept	Shows whether Accept Mode is enabled for the VRRP interface. When enabled, the virtual router designated as the master will allow others to access its own virtual IP address.
Tracking Interface	Shows whether Native Interface Tracking is enabled for the VRRP interface.
Tracking Ping	Shows the tracking ping status of the VRRP interface.

VRRP - Create Virtual Router

Menu Path: [Redundancy](#) > [Layer 3 Redundancy](#) > [VRRP - Settings](#)

Clicking the **Add (+)** icon on the **Redundancy > Layer 3 Redundancy > VRRP - Settings** page will open this dialog box. This dialog lets you create a new virtual router for your device. Click **CREATE** to save your changes and add the new account.

Limitations

You can create up to 16 virtual routers.

VRRP Interface Setting Entry

UI Setting	Description	Valid Range	Default Value
Status	Enable or disable the VRRP interface.	Enabled / Disabled	Disabled
Interface	Specify which network interface to use for the VRRP interface.	Drop-down list of interfaces	

UI Setting	Description	Valid Range	Default Value
Virtual IP	Specify the virtual router IP address for the VRRP interface.	Valid IP address	N/A
	<p> Note</p> <p>Devices in the same VRRP group must be in the same subnet.</p>		
Virtual Router ID	Specify the virtual router ID to use for the VRRP interface. The virtual router ID is used to assign the virtual router to a VRRP group.	1-255	1
	<p> Note</p> <p>Devices that operate as master/backup should have the same ID. Each interface supports one virtual router ID.</p>		
Priority	Specify the priority of the VRRP interface. Higher numbers indicate higher priority, with 254 being the highest.	1-254	100
	<p> Note</p> <p>If multiple devices have the same priority, the device with the highest IP address will have priority.</p>		
Accept Mode	Enable or disable Accept Mode for the VRRP interface. When enabled, the virtual router designated as the master will allow others to access its own virtual IP address.	Enabled / Disabled	Enabled
Preemption	Enable or disable preemption for the VRRP interface. When enabled, preemption will decide if the master will retake authority or not after being unavailable.	Enabled / Disabled	Enabled
Preempt Delay (if Preemption is Enabled)	Specify the preemption delay in seconds to use for the VRRP interface. The preempt delay is the amount of time the master will wait before retaking authority back in order to prevent the master from acting before the network connection is ready.	10-300 sec	120
Advertisement Interval	Specify the advertisement interval in milliseconds for the VRRP interface. This determines the interval for the master sending packets to all slave devices to inform them who the master device is.	10-30000 ms	100

VRRP Tracking

Note

If either Native Interface Tracking or Object Ping Tracking determines a connection failure, the VRRP status will be switched to INIT mode.

UI Setting	Description	Valid Range	Default Value
Native Tracking Interface	Disable or specify which interface to use for Native Interface Tracking for the VRRP interface. When enabled, if all interfaces on the device are disconnected, it will be considered to be a disconnection.	Disabled / Drop-down list of interfaces	Disabled
Target IP	Specify the target IP to ping to verify if the connection to the destination is working. Leaving this field empty or entering 0.0.0.0 will disable object ping tracking for the VRRP interface.	Valid IP address	N/A
	<div data-bbox="397 936 1032 1102"><h3> Note</h3><p>Moxa devices will decide which interface/source IP to use for pinging the target IP based on the routing table.</p></div>		
Interval	Specify the interval in seconds the device will use for pinging the target IP.	1-100 sec	1
Timeout	Specify the timeout duration in seconds the device will wait for a response before timing out.	1-100 sec	3
Success Count	Specify the success count, which indicates how many responses the device must receive to consider the connection as working.	1-100	3
Failure Count	Specify the failure count, which indicates how many times the target IP fails to respond before the device considers the connection as not working.	1-100	3

VRRP - Edit Virtual Router

Menu Path: [Redundancy](#) > [Layer 3 Redundancy](#) > [VRRP - Settings](#)

Clicking the **Edit** () icon for a VRRP interface on the **Redundancy > Layer 3 Redundancy > VRRP - Settings** page will open this dialog box. This dialog lets you edit an existing virtual router. Click **APPLY** to save your changes.

Delete Virtual Router

Menu Path: Redundancy > Layer 3 Redundancy > VRRP - Settings

You can delete VRRP interfaces by using the checkboxes to select the interfaces you want to delete, then clicking the **Delete** () icon.

VRRP - Status

Menu Path: Redundancy > Layer 3 Redundancy > VRRP - Status

This page lets you see the status of your device's VRRP interfaces.

UI Setting	Description
Status	Shows the status of the VRRP interface.
Index	Shows the index number used to identify the VRRP interface.
Interface	Shows which network interface is used for the VRRP interface.
VRRID	Shows the virtual router ID for the VRRP interface, which is used to assign the virtual router to a VRRP group.

UI Setting	Description
State	Shows the state of the VRRP interface. Init State: This is the initial state when a virtual router starts up. Master State: The virtual router is acting as a master, and is responsible for forwarding packets sent to the virtual IP address and acting as the default gateway for the devices in the network. Backup State: The virtual router is in the backup state, and waiting to take over the master role if the current master fails.
Master Address	Shows IP address of the current master for the VRRP interface.

Network Service

Menu Path: Network Service

The Network Service settings area lets you configure the main system settings for your device.

This settings area includes these sections:

- DHCP Server
- Dynamic DNS

Network Service - User Privileges

Privileges to Network Service settings are granted to the different authority levels as follows. Refer to [System > Account Management > User Accounts](#) for more information on user accounts.

Settings	Admin	Supervisor	User
DHCP Server	R/W	R/W	R
Dynamic DNS	R/W	R/W	R

DHCP Server

Menu Path: Network Service > DHCP Server

This page lets you manage the DHCP server settings of your device.

This page includes these tabs:

- General
- DHCP
- MAC-based IP Assignment
- Port-based IP Assignment
- Lease Table
- DHCP Relay Agent

DHCP Server - General

Menu Path: Network Service > DHCP Server - General

This page lets you enable the DHCP server feature of your device. Click **APPLY** to save your changes.

The screenshot shows the 'DHCP Server' configuration page with the 'General' tab selected. The 'Mode' dropdown menu is set to 'Disabled'. An 'APPLY' button is located below the dropdown menu.

UI Setting	Description	Valid Range	Default Value
Mode	Select the DHCP Server Mode. Each mode has its own configuration settings.	Disabled / DHCP / MAC-based assignment / Port-based IP assignment	Disabled

DHCP

Menu Path: Network Service > DHCP Server - DHCP

This page lets you set up your device's DHCP server settings to automatically assign an IP address from a user-configured IP address pool to connected Ethernet devices.

Note

The DHCP Server is only available for LAN interfaces. The DHCP pool's Starting/Ending IP Address must be in the same LAN subnet.

Limitations

You can create up to 32 DHCP server pools.

DHCP Server Pools

The screenshot shows the DHCP Server configuration page with the following table:

Status	Pool IP Range	Subnet Mask	Lease Time (min.)	Default Gateway	DNS Server 1	DNS Server 2	NTP Server
  Disabled	192.168.127.1 - 192.168.127.253	255.255.255.0	60	192.168.127.254	0.0.0.0	0.0.0.0	0.0.0.0

Max: 32 | 1 - 1 of 1 | < >

UI Setting

Description

Status	Shows the status of the DHCP server pool.
Pool IP Range	Shows the IP range of the pool.
Subnet Mask	Shows the subnet mask to use for DHCP clients in the pool.
Lease Time	Shows the lease time to use for IP addresses assigned by the DHCP server for the pool.
DNS Server 1	Shows the IP address to use for the first DNS server for DHCP clients in the pool.
DNS Server 2	Shows the IP address to use for the second DNS server for DHCP clients in the pool.

UI Setting	Description
NTP Server	Shows the IP address to use for the NTP server for DHCP clients in the pool.

DHCP - Create DHCP Server Pool

Menu Path: Network Service > DHCP Server – DHCP

Clicking the **Add (+)** icon on the **Network Service > DHCP Server - DHCP** page will open this dialog box. This dialog lets you create a new DHCP server pool. Click **CREATE** to save your changes and add the new account.

DNS Server 1	Specify the IP address to use for the first DNS server for DHCP clients in the pool.	Valid IP address	N/A
DNS Server 2	Specify the IP address to use for the second DNS server for DHCP clients in the pool.	Valid IP address	N/A
NTP Server	Specify the IP address to use for the NTP server for DHCP clients in the pool.	Valid IP address	N/A

DHCP - Delete DHCP Server Pool

Menu Path: Network Service > DHCP Server - DHCP

You can delete a DHCP server pool by clicking the **Delete (🗑)** icon for the pool.

DHCP Server - MAC-based IP Assignment

Menu Path: Network Service > DHCP Server - MAC-based IP Assignment

This page lets you manage the DHCP server's MAC-based IP assignments.

MAC-based IP assignment is a method of managing IP address allocation on a DHCP server by associating specific IP addresses with the unique MAC addresses of devices on a network. This approach allows network administrators to ensure that certain devices always receive the same IP address, regardless of their connection order or lease duration. By configuring the DHCP server with a table of MAC addresses and their corresponding IP addresses, administrators can have greater control over IP address allocation and enhance network security and management.

Limitations

You can create up to 256 MAC-based IP assignments.

DHCP Server									
General	DHCP	MAC-based IP Assignment	Port-based IP Assignment	Lease Table	DHCP Relay Agent				
Status	Name	IP Address	Subnet Mask	MAC Address	Lease Time (min.)	Default Gateway	DNS Server 1	DNS Server 2	
<input type="checkbox"/>	Disabled	UserManualCASEtest	192.168.127.101	255.255.255.0	00:09:ad:00:aa:01	1440	0.0.0.0	0.0.0.0	0.0.0.0

UI Setting

Description

Status	Shows the status of the MAC-based IP assignment.
Name	Shows the hostname for the device.
IP Address	Shows the IP address of the device.
Subnet Mask	Shows the subnet mask of the device.
MAC Address	Shows the MAC address of the device.
Default Gateway	Shows the default gateway of the device.

UI Setting	Description
Lease Time	Shows the lease time for IP addresses assigned by the DHCP server.
DNS Server 1	Shows the IP address for the first DNS server.
DNS Server 2	Shows the IP address for the second DNS server.
NTP Server	Shows the IP address for the NTP server.

MAC-based IP Assignment - Create Entry

Menu Path: [Network Service](#) > [DHCP Server - MAC-based IP Assignment](#)

Clicking the **Add (+)** icon on the **Network Service > DHCP Server - MAC-based IP Assignment** page will open this dialog box. This dialog lets you add a new MAC-based IP assignment. Click **CREATE** to save your changes and add the new assignment.

MAC-based IP Assignment - Delete Entry

Menu Path: Network Service > DHCP Server - MAC-based IP Assignment

You can delete a MAC-based IP assignment by using the checkboxes to select the entries you want to delete, then clicking the **Delete (🗑)** icon.

DHCP Server - Port-based IP Assignment

Menu Path: Network Service > DHCP Server - Port-based IP Assignment

This page lets you manage port-based IP assignment for your device's DHCP server.

Port-based IP assignment is a method of managing IP address allocation on a DHCP server by associating specific IP addresses with the physical ports on network equipment, such as switches or routers. This approach provides network administrators with the ability to assign predetermined IP addresses to devices based on the network port they are connected to.

 **Limitations**

You can create up to 10 port-based IP assignments.

The screenshot shows the 'DHCP Server' configuration page with the 'Port-based IP Assignment' tab selected. It features a table with columns for Port, Status, IP Address, Subnet Mask, Lease Time (min.), Default Gateway, DNS Server 1, DNS Server 2, and NTP Server. A single entry is visible for port 3 with status 'Enabled', IP address 192.168.127.2, subnet mask 255.255.255.0, lease time 1440, and default gateway 0.0.0.0. The page also includes a search bar and pagination controls.

Port	Status	IP Address	Subnet Mask	Lease Time (min.)	Default Gateway	DNS Server 1	DNS Server 2	NTP Server
3	Enabled	192.168.127.2	255.255.255.0	1440	0.0.0.0	0.0.0.0	0.0.0.0	0.0.0.0

Static Multicast Route	R/W	R/W	R
Broadcast Forwarding	R/W	R/W	R

Unicast Route

Menu Path: [Routing](#) > [Unicast Route](#)

This section lets you manage unicast routes for your device.

This section includes these pages:

- [Static Routes](#)
- [RIP](#)
- [OSPF](#)
- [Routing Table](#)

Static Routes

Menu Path: [Routing](#) > [Unicast Route](#) > [Static Routes](#)

This page lets you manage static routes for your device, which allows you to specify the

next hop (or router) that the device will forward data to for a specific subnet. Static routes will be added to the routing table and stored on the device.

Limitations

You can create up to 512 static routes.

Static Route List

Status	Name	Destination Address	Netmask	Next Hop	Metric
--------	------	---------------------	---------	----------	--------

UI Setting	Description
Status	Shows the status of the static route.
Name	Shows the name of the static route.
Destination Address	Shows the destination IP address for the static route.
Netmask	Shows the subnet mask for the destination IP address.
Next Hop	Shows the next router on the path to the destination IP address.
Metric	Shows the metric value used to determine the priority of the static route. Lower values have higher priority.

Create New Static Route

Menu Path: [Routing](#) > [Unicast Route](#) > [Static Routes](#)

Clicking the **Add** () icon on the **Routing > Unicast Route > Static Routes** page will open this dialog box. This dialog lets you create a new static route. Click **CREATE** to save your changes and add the new account.

OSPF

Menu Path: [Routing](#) > [Unicast Route](#) > [OSPF](#)

This section lets you configure OSPF (Open Shortest Path First) routing for your device.

This section includes these pages:

- OSPF Settings
- OSPF Status

OSPF Settings

Menu Path: Routing > Unicast Route > OSPF > OSPF Settings

This page lets you configure OSPF settings for your device.

This page includes these tabs:

- General
- Area
- Interface
- Aggregation
- Virtual Link

OSPF Settings - General

Menu Path: Routing > Unicast Route > OSPF > OSPF Settings - General

This page lets you adjust the basic settings for OSPF. Click **APPLY** to save your changes.

The screenshot displays the 'OSPF Settings' configuration page. At the top, there are five tabs: 'General', 'Area', 'Interface', 'Aggregation', and 'Virtual Link'. The 'General' tab is active. Below the tabs, the 'OSPF Settings' dropdown menu is set to 'Disabled'. The 'Router ID' is set to '0.0.0.0' and the 'Current Router ID' is also set to '0.0.0.0'. A red information icon is present next to the 'Current Router ID' field. The 'Redistribute' dropdown menu is also visible. At the bottom left, there is a green 'APPLY' button.

UI Setting	Description	Valid Range	Default Value
OSPF Settings	Enable or disable OSPF for your device.	Enabled / Disabled	Disabled
Router ID	Specify the Router ID of your Moxa router.	Router ID	0.0.0.0
	<p> Note</p> <p>The router ID, which must be established for every OSPF instance, should be written in the dot-decimal format of an IP address (e.g., 1.2.3.4) and does not need to be part of any routable subnet on the network, since it is an IP address.</p>		
Current Router ID (View-only)	Specify the current Router ID of your Moxa router.	Current Router ID	0.0.0.0
	<p> Note</p> <p>When the Router ID is set to 0.0.0.0, the Current Router ID will automatically use the highest interface IP address.</p>		
Redistribute	Specify the OSPF redistribution method: Connected: Entries learned from the directly connected interfaces will be redistributed. Static: Entries set in a static route will be redistributed. RIP: Entries learned from RIP will be redistributed.	Connected / Static / RIP	N/A
	<p> Note</p> <p><i>Redistributing</i> in OSPF refers to the process of importing routing information from other routing protocols—such as RIP, EIGRP, etc.—into the OSPF routing table.</p>		

OSPF Settings - Area

Menu Path: [Routing](#) > [Unicast Route](#) > [OSPF](#) > [OSPF Settings - Area](#)

This page lets you define OSPF areas.

Note

Areas are used to divide a large network into smaller network areas. Each area maintains a separate link state database whose information may be summarized towards the rest of the network by the connecting router. Thus, the topology of an area is unknown outside of the area. This reduces the amount of routing traffic between parts of an autonomous system.

Limitations

You can create up to 5 OSPF areas.

OSPF Area List

UI Setting	Description
Area ID	Shows the area's ID.
Area Type	Shows the type of OSPF routing used for the area.
Metric (Only for Metric is Stub/NSSA)	Shows the metric value/cost for OSPF in the area.

Create Area

Menu Path: [Routing](#) > [Unicast Route](#) > [OSPF](#) > [OSPF Settings - Area](#)

Clicking the **Add (+)** icon on the **Routing > Unicast Route > OSPF > OSPF Settings - Area** page will open this dialog box. This dialog lets you create a new OSPF area.

Click **CREATE** to save your changes and add the new area.

Create Area

CREATE

UI Setting	Description	Valid Range	Default Value
Area ID	Specify an ID for this OSPF area.	N/A	N/A
Area Type	Specify the type of OSPF routing to use for this area: Normal: A normal (or standard) area is an OSPF area that allows both intra-area and inter-area routing. Stub: A stub area is an OSPF area that does not allow external routes to be imported into the area. NSSA: An NSSA (Not-So-Stubby Area) is a special type of OSPF area that allows external routing information to be imported into the area, but does not allow the area to propagate that information to other areas.	Normal / Stub / NSSA	Normal
Metric (if Metric is Stub or NSSA)	Specify the metric value/cost to use for this area.	1 to 65535	1
<p> Note</p> <p>Metrics are used to calculate the shortest path for data to travel through the network, and are determined by assigning cost values to the interfaces connecting to each router. The lower the cost value, the more the path will be preferred.</p>			

Edit Area

Menu Path: Routing > Unicast Route > OSPF > OSPF Settings - Area

Clicking the **Edit** (✎) icon for an OSPF area on the **Insert > Path Here** page will open this dialog box. This dialog lets you modify an existing OSPF area. Click **APPLY** to save your changes.

<input type="checkbox"/>	Interface	IP Address	Area ID	Hello Interval (sec.)	Dead Interval (sec.)	Role	Priority	Auth Type	MD5 Key ID	Metric
<input type="checkbox"/>	WAN	10.123.13.33	0.0.0.0	10	40	DR	1	MD5	12	1
Max. 15 Items per page: 50 1 - 1 of 1 < > 										

UI Setting	Description
Interface	Shows which interface this entry describes.
IP Address	Shows the IP address of the interface.
Area ID	Shows the OSPF area ID used for the interface.
Hello Interval	Shows the hello message interval for the interface.
Dead Interval	Shows the dead interval for the interface.
Role	Shows the role of the interface.
Priority	Shows the priority of the interface.
Auth Type	Shows the authentication type used to authenticate OSPF neighbors.
MD5 Key ID (Only if Auth Type is MD5)	Shows the MD5 key ID used to authenticate OSPF neighbors.
Metric	Shows the metric value/cost to OSPF.

Note

Metrics are used to calculate the shortest path for data to travel through the network, and are determined by assigning cost values to the interfaces connecting to each router. The lower the cost value, the more the path will be preferred.

OSPF Settings - Create Interface

Menu Path: Routing > Unicast Route > OSPF > OSPF Settings - Interface

Clicking the **Add (+)** icon on the **Insert > Path Here** page will open this dialog box. This dialog lets you select an interface and configure OSPF settings for it.

Click **CREATE** to save your changes and add the new entry.

Note
 You cannot create new interfaces in this dialog; you can only select existing interfaces. To create a new interface, refer to [Network Configuration > Network Interfaces](#).

UI Setting	Description	Valid Range	Default Value
Interface	Specify which interface to assign to an OSPF area.	Dropdown of interfaces	N/A

UI Setting	Description	Valid Range	Default Value
Area ID	Specify an OSPF area ID to assign to the interface.	Dropdown of area IDs	N/A
	<p> Note</p> <p>To manage OSPF areas, refer to Routing > Unicast Route > OSPF > OSPF Settings - Area.</p>		
Priority	Specify the priority of the interface.	0 to 255	1
Hello Interval	Set the hello message interval for the interface. The hello interval is the amount of time between sends of hello packets, which indicate that the device is still alive. The value of all hello intervals must be the same within a network.	1 to 65535 second(s)	10
Dead Interval	Set the dead interval for the interface. The dead interval is the amount of time a device will wait for a hello packet. If a hello packet is not received in this time, it will consider the other device to be dead or unavailable. By default, the dead interval is set to be four times the value of the hello interval.	1 to 65535 second(s)	40
Auth Type	Specify the authentication type to use when authenticating OSPF neighbors. None: No authentication method will be used for neighbor authentication. Simple: Neighbors will be authenticated using an auth key. MD5: Neighbors will be authenticated more securely by using an auth key and an MD5 key ID.	None / Simple / MD5	N/A
Auth Key (Only if Auth Type is Simple or MD5)	Specify the auth key to use for neighbor authentication. If the Auth Type is Simple, the auth key will be a pure-text password. If the Auth Type is MD5, the auth key will be an encrypted password.	1 to 8 characters	N/A
MD5 Key ID (Only if Auth Type is MD5)	Specify the MD5 key ID to use for neighbor authentication.	1 to 255	1
	<p> Note</p> <p>MD5 authentication method uses MD5 to calculate a hash value from the contents of the OSPF packet and the authentication key. This hash value is transmitted in the packet, along with a key ID.</p>		

UI Setting	Description	Valid Range	Default Value
Metric	Specify the metric value/cost for OSPF.	1 to 65535	1

 **Note**

Metrics are used to calculate the shortest path for data to travel through the network, and are determined by assigning cost values to the interfaces connecting to each router. The lower the cost value, the more the path will be preferred.

OSPF Settings - Edit Interface

Menu Path: Routing > Unicast Route > OSPF > OSPF Settings - Interface

Clicking the **Edit (✎)** icon for an entry on the **Insert > Path Here** page will open this dialog box. This dialog lets you edit existing OSPF settings for an interface. Click **APPLY** to save your changes.

OSPF Settings - Aggregation

Menu Path: Routing > Unicast Route > OSPF > OSPF Settings - Aggregation

This page lets you aggregate different OSPF areas into a single routing table entry.

Limitations

You can create up to 5 OSPF aggregations.

UI Setting

Description

Area ID	Shows the area ID.
IP Address	Shows the IP address of the area.
Subnet Mask	Shows the network subnet mask.

Create an Aggregation

Menu Path: Routing > Unicast Route > OSPF > OSPF Settings - Aggregation

Clicking the **Add (+)** icon on the **Routing > Unicast Route > OSPF > OSPF Settings - Aggregation** page will open this dialog box. This dialog lets you create an OSPF aggregation. Click **CREATE** to save your changes and add the new aggregation.

Create Aggregation

Area ID *

IP Address * Subnet Mask *

UI Setting	Description	Valid Range	Default Value

Subnet Mask	Select the network subnet mask to use for the area.	Dropdown list of subnet masks	N/A

Edit an Aggregation

Menu Path: Routing > Unicast Route > OSPF > OSPF Settings - Aggregation

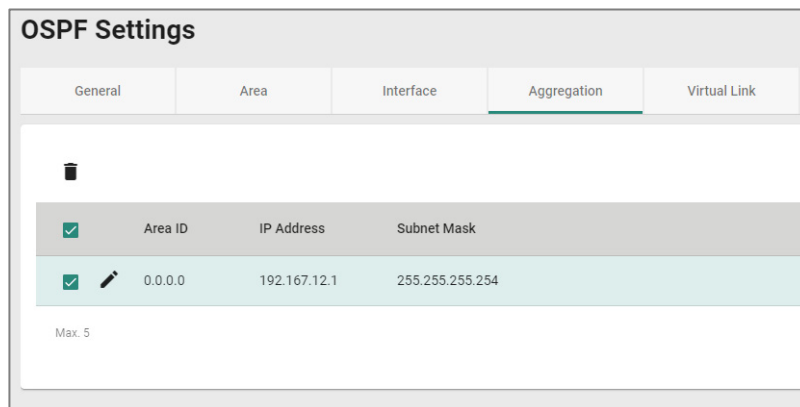

Clicking the **Edit (✎)** icon for an entry on the **Routing > Unicast Route > OSPF > OSPF Settings - Aggregation** page will open this dialog box. This dialog lets you modify an existing aggregation. Click **APPLY** to save your changes.

UI Setting	Description	Valid Range	Default Value
Area ID	Select the area ID that you want to use for the aggregation.	Dropdown list of area IDs	N/A
IP Address	Specify the IP address to use for the area.	Valid IP address	N/A
Subnet Mask	Select the network subnet mask to use for the area.	Dropdown list of subnet masks	N/A

Delete an Aggregation

Menu Path: Routing > Unicast Route > OSPF > OSPF Settings - Aggregation

You can delete an entry by using the checkboxes to select the entries you want to delete, then clicking the **Delete (🗑)** icon.

Virtual Link

Menu Path: Routing > Unicast Route > OSPF > OSPF Settings - Virtual Link

This page lets you configure virtual links, which can be used to connect areas in an OSPF autonomous system when physical connection to the backbone area is not possible.

Limitations

You can create up to 5 OSPF virtual links.

OSPF Status

Menu Path: Routing > Unicast Route > OSPF > OSPF Status

This page lets you view the OSPF routing status of your device.

This page includes these tabs:

- Neighbor
- Database

Neighbor

Menu Path: Routing > Unicast Route > OSPF > OSPF Status - Neighbor

This page lets you see the status of OSPF neighbors. OSPF neighbors are devices that share their link-state information with other devices in the network.

UI Setting	Description
Neighbor ID	Shows the unique identifier for the OSPF neighbor.
Priority	Shows priority value that the neighbor has assigned to itself.
State	Shows the current state of the OSPF neighbor relationship: Down: The initial state before any OSPF communication has occurred between two routers. Init: The state where the local router has sent an OSPF Hello packet to a neighbor but has not yet received a response. 2-way: The state where both routers have exchanged Hello packets and can become neighbors, but they have not yet established a bidirectional relationship. Exstart: The state where the routers determine which one will be the master and which one will be the slave during the database exchange process. Exchange: The state where the routers exchange link-state advertisement (LSA) headers and determine which LSAs need to be sent. Loading: The state where the routers exchange LSAs to synchronize their link-state databases. Full: The final state where the routers have a complete and accurate view of the network topology and are ready to forward traffic.
IP Address	Shows the IP address of the neighbor router's interface used for OSPF communication.
Interface Name	Shows the name of the local interface used for OSPF communication with the neighbor.

Database

Menu Path: Routing > Unicast Route > OSPF > OSPF Status - Database

This page lets you see the list of link-state advertisements (LSAs) that describe the network topology, which is used to calculate the shortest path to a destination.

UI Setting	Description	Valid Range	Default Value
LSA Type	Shows the type of the LSA, which describes the contents of the OSPF LSA packet. Router LSA: Describes the links attached to a router and is flooded within the same area as the router. Network LSA: Describes the routers attached to a multi-access network. Summary LSA: Advertises reachability information between OSPF areas. AS External LSA: Advertises routes to networks outside the OSPF domain. NSSA External LSA: Similar to the Type 5 LSA, but used in a Not-So-Stubby Area (NSSA) to advertise external routes. Link-local LSA: Used to advertise IPv6 link-local addresses and is flooded throughout the same link-local scope.	N/A	N/A
Area	Identifies the area of the network to which the LSA belongs.	N/A	N/A
Link ID	Identifies the endpoint of the link described by the LSA.	N/A	N/A
ADV Router	Identifies the router that the LSA originated from.	N/A	N/A
Route	OSPF uses the information in the LSAs to calculate the shortest path to a destination.	N/A	N/A

Routing Table

Menu Path: Routing > Unicast Route > Routing Table

This page lets you see the current routing table for your device.

Index	Type	Destination Address	Next Hop	Interface	Metric
1	default	0.0.0.0	10.123.12.1	WAN	1
2	connected	10.123.12.0/23	10.123.12.33	WAN	1
3	connected	192.168.127.0/24	192.168.127.254	LAN	1

UI Setting	Description
Index	Shows the unique identifier for the routing table entry.
Type	Shows the source type of the route.
Destination Address	Shows the address of the destination network for the route.
Next Hop	Shows the IP address of the next hop router or gateway that the packet should be forwarded to.
Interface	Shows the outgoing interface that should be used to reach the destination network.
Metric	Shows the metric value/cost of the route to the destination network.

Note

Metrics are used to calculate the shortest path for data to travel through the network, and are determined by assigning cost values to the interfaces connecting to each router. The lower the cost value, the more the path will be preferred.

Multicast Route

Menu Path: Routing > Multicast Route

This section lets you configure multicast routing for your device.

This section includes these pages:

- Multicast Route Settings
- Static Multicast Route
- Multicast Forwarding Table

Multicast Route Settings

Menu Path: Routing > Multicast Route > Multicast Route Settings

This page lets you enable or disable multicast routing. Click **APPLY** to save your changes.

Multicast Route Settings

UI Setting	Description	Valid Range	Default Value
Mode	Enable or disable multicast routing.	Disabled / Static Multicast Route	Disabled

Static Multicast Route

Menu Path: Routing > Multicast Route > Static Multicast Route

This page lets you manage multicast routes for your device.

Limitations

You can create up to 256 static multicast routes.

UI Setting	Description
Status	Shows whether the static multicast route is enabled or disabled.
Group Address	Shows the group IP address for the route.
Source Address	Shows the source address for the route.
Inbound Interface	Shows the inbound interface for the route.
Outbound Interface	Shows the outbound interfaces for the route.

Create Static Multicast Route

Menu Path: Routing > Multicast Route > Static Multicast Route

Clicking the **Add (+)** icon on the **Routing > Multicast Route > Static Multicast Route** page will open this dialog box. This dialog lets you add a new static multicast route. Click **CREATE** to save your changes and add the new account.

Create Static Multicast Route

N-to-1: N-to-1 NAT maps multiple private IP addresses to one public IP address. PAT: Port Address Translation (PAT) maps multiple private IP addresses to one public IP address using different port numbers. Advance: Allows you to set up an advanced NAT rule.	1-to-1 / N-to-1 / PAT / Advance	1-to-1
Auto Create Source NAT	Enable or disable the Auto Create Source NAT feature. If this is disabled, 1-to-1 NAT will only perform DNAT.	Enabled / Disabled	Disabled
NAT Loopback	Enable or disable NAT Loopback. NAT loopback allows devices on a private network to access a server or service hosted on the same network using the public IP address of the network.	Enabled / Disabled	Disabled
Double NAT	Enable or disable Double NAT. Double NAT enables you to use 1-to-1 rules to facilitate two-way communication.	Enabled / Disabled	Disabled
VRRP Binding	Select which VRRP index this rule should use, or disable VRRP binding. Virtual Router Redundancy Protocol (VRRP) Binding is a feature that allows the 1-to-1 NAT rule to be bound to a VRRP index. VRRP Binding is only supported in 1-to-1 NAT. If a VRRP index is selected, the 1-to-1 NAT rule is only valid when the system is the master. If no VRRP index is selected, the 1-to-1 NAT rule will be valid regardless of whether the system is the master or backup.	Disabled / VRRP Index No.	Disabled

Create Index - Advance

If **Advance** is selected for the **Mode**, these settings will appear. This mode allows you to set up an advanced NAT rule, which can provide you with more flexibility for NAT configuration.

Note

Please keep these in mind before setting up an advanced NAT rule:

- When using a **Range**, please ensure that the corresponding **Range** values are consistent.
- NAT Advance Mode only allows for a single range to be entered and does not support configuring multiple ranges in the same rule.
- Port settings can only be configured when the Protocol includes either TCP or UDP.
- If a **Translated Destination IP** is used, the **Outgoing Interface** cannot be configured.
- If the **Translated Source IP** is set to **Dynamic**, the **Translated Source Port** cannot be set.

Object Management

Menu Path: Object Management

This page lets you use object-based firewall management to help protect your network on a granular level.

Object Management - User Privileges

Privileges to Object Management settings are granted to the different authority levels as follows. Refer to [System > Account Management > User Accounts](#) for more information on user accounts.

Settings	Admin	Supervisor	User
Object Management	R/W	R/W	R

You can create, modify, and edit the objects you need based on your security requirements. These objects are used when creating Layer 3-7 policies for the device's firewall.

In addition, objects allow for more efficient firewall rule management. A single object can be assigned to multiple rules and changes to the object will apply to all associated rules, removing the need to update individual policies one by one.

Limitations

You can create up to 512 objects.

		Search		
<input type="checkbox"/>	Name	Type	Details	References
<input type="checkbox"/>	MOXA_Test	IP Address and Subnet	10.0.0.1 - 10.0.0.10	0

CREATE

UI Setting	Description	Valid Range	Default Value
Name	Specify a name for the object.	1 to 32 characters	N/A
Object Type	Select a type for the object. IP Address and Subnet: You can specify an IP address, a range of IP addresses, or a subnet. Network Service: You can select from a list of protocol and port combinations used for common network services. Industrial Application Service: You can select from a list of protocol and port combinations used for industrial communications and applications. User-defined Service: You can specify your own protocol and port combination.	IP Address and Subnet / Network Service / Industrial Application Service / User-defined Service	N/A
IP Protocol	Select the IP protocols to use for the object.	TCP / UDP / TCP and UDP / ICMP Custom IP Protocol	N/A

UI Setting	Description	Valid Range	Default Value
Service Port Type (If TCP, UDP, or TCP and UDP is selected for IP Protocol)	Select how to define ports for the object. Any: All ports will be included. Single TCP and UDP Port: Specify a single port to include. TCP and UDP Port Range: Specify a range of ports to include.	Any / Single TCP and UDP Port / TCP and UDP Port Range	
Port (If Single TCP and UDP Port is selected for Service Port Type)	Specify a port to include.	1 to 65535	N/A
Port: Start (If TCP and UDP Port Range is selected for Service Port Type)	Specify the start of the port range to use for the object.	1 to 65535	N/A
Port: End (If TCP and UDP Port Range is selected for Service Port Type)	Specify the end of the port range to use for the object.	1 to 65535	N/A
ICMP Type (Decimal) (If ICMP is selected for IP Protocol)	Specify the ICMP type in decimal form to use for the object. Leave this blank to allow all ICMP types to be included.	Blank, 0 to 255	N/A
ICMP Code (Decimal) (If ICMP is selected for IP Protocol)	Specify the ICMP code in decimal form to use for the object. Leave this blank to allow all ICMP codes to be included.	Blank, 0 to 255	N/A
IP Protocol (Decimal) (If Custom IP Protocol is selected for IP Protocol)	Specify the IP protocol in decimal form to use for the object.	0 to 255	N/A

Edit Object

Menu Path: Object Management

Clicking the **Edit** (✎) icon for an object on the **Object Management** page will open this dialog box. This dialog lets you edit an existing object. Click **APPLY** to save your changes.

Available settings will vary depending on which **Object Type** the object uses.

Note

When editing an object, you cannot change its **Object Type**.

Edit Object - IP Address and Subnet

If **IP Address and Subnet** is selected for the **Object Type**, these settings will appear.

UI Setting	Description	Valid Range	Default Value
Name	Specify a name for the object.	1 to 32 characters	N/A
Object Type (View-only)	Shows the type for the object. This setting cannot be changed when editing an object.	IP Address and Subnet	IP Address and Subnet

UI Setting	Description	Valid Range	Default Value
IP Type	Select the type of IP address to use for the object.	Single IP / IP Range / Subnet	N/A
IP Address (If Single is selected for IP Type)	Specify the IP address to use for the object.	Valid IP Address	N/A
IP Address: Start (If IP Range is selected for IP Type)	Specify the start of the IP range to use for the object.	Valid IP Address	N/A
IP Address: End (If IP Range is selected for IP Type)	Specify the end of the IP range to use for the object.	Valid IP Address	N/A
Subnet (If Subnet is selected for IP Type)	Specify the IP address of the subnet to use for the object.	Valid IP Address	N/A
Subnet Mask (If Subnet is selected for IP Type)	Select the subnet mask to use for the object.	Drop-down list of subnet masks	N/A

Edit Object - Network Service

If **Network Service** is selected for the **Object Type**, these settings will appear.

UI Setting	Description	Valid Range	Default Value
Name	Specify a name for the object.	1 to 32 characters	N/A
Object Type (View-only)	Shows the type for the object. This setting cannot be changed when editing an object.	Network Service	Network Service

UI Setting	Description	Valid Range	Default Value
Select Network Service(s)	Select a category of network services, or individual services to use for the object. You can select multiple options.	Remote-Access / Remote-Desktop / Email / File-Transfer / Web-Access / Network-Service / Authentication / VOIP-and-Streaming / SQL-Server	N/A
Remote-Access	This category includes protocols used for remote access to a device.	WINS (TCP 1512; UDP 1512) TELNET (TCP 23) SSH (TCP 22)	N/A
Remote-Desktop	This category includes protocols used by various remote desktop services.	PC-Anywhere (TCP 5631; UDP 5632) Chrome-Remote-Desktop (UDP 5222) AnyDesk (TCP 6568, 7070; UDP 50001 - 50003) Teamviewer (TCP 5938) RDP (TCP 3389) VNC (TCP 5900) X-WINDOW (TCP 6000 - 6063)	N/A
Email	This category includes protocols used for sending and receiving emails.	IMAP (TCP 143) IMAPS (TCP 993) POP3 (TCP 110) POP3S (TCP 995) SMTP (TCP 25) SMTPS (TCP 465)	N/A
File-Transfer	This category includes protocols used for different methods of file transfer.	FTP (TCP 21) FTPS (TCP 990) SFTP (TCP 115; UDP 115) TFTP (UDP 69) NFS (TCP 111, 2049; UDP 111, 2049) SAMBA (TCP 139) AFS3 (TCP 7000 - 7009; UDP 7000 - 7009) SMB (TCP 445)	N/A
Web-Access	This category includes protocols used by web browsers.	HTTP (TCP 80) HTTPS (TCP 443)	N/A
Network-Service	This category includes protocols used by various network services.	BGP (TCP 179) DHCP (UDP 67) DHCP6 (UDP 546) DNS (TCP 53; UDP 53) NTP (TCP 123; UDP 123) ICMP-PING (ICMP Type Any Code Any) OSPF (IP Protocol 89) RIP (TCP 520) SNMP (TCP 161 - 162; UDP 161 - 162) SYSLOG (UDP 514)	N/A
Authentication	This category includes protocols used by authentication services.	LDAP (TCP 389; UDP 389) LDAPS (TCP 636; UDP 636) RADIUS (UDP 1812 - 1813) TACACS+ (TCP 49; UDP 49)	N/A

UI Setting	Description	Valid Range	Default Value
VOIP-and-Streaming	This category includes protocols used for VOIP calling and streaming video.	SIP (TCP 5060; UDP 5060) RSTP (TCP 554, 7070, 8554; UDP 554)	N/A
SQL-Server	This category includes protocols used for SQL servers.	MS-SQL (TCP 1433 - 1434) MYSQL (TCP 3306)	N/A

Delete Object

Menu Path: Object Management

You can delete an object by using the checkboxes to select the entries you want to delete, then clicking the **Delete (🗑)** icon.

Firewall

Menu Path: Firewall

The Firewall settings area lets you configure settings related to your device's firewall.

This settings area includes these sections:

- Layer 2 Policy
- Layer 3-7 Policy
- Malformed Packets
- Session Control
- DoS Policy
- Soft Lockdown Mode
- Advanced Protection

Network Configuration - User Privileges

Privileges to Firewall settings are granted to the different authority levels as follows. Refer to [System > Account Management > User Accounts](#) for more information on user accounts.

Settings	Admin	Supervisor	User
Layer 2 Policy	R/W	R/W	R
Layer 3 - 7 Policy	R/W	R/W	R
Malformed Packets	R/W	R/W	R
Session Control	R/W	R/W	R
DoS Policy	R/W	R/W	R
Soft Lockdown Mode	R/W	R/W	R
Advanced Protection			
Dashboard	R/W	R/W	-

Protocol Filter Policy	R/W	R/W	-
ADP	R/W	R/W	-
IPS	R/W	R/W	-

Layer 2 Policy

Menu Path: Firewall > Layer 2 Policy

This page lets you configure advanced Layer 2 policies for your device's firewall. Layer 2 firewall policies can filter packets from bridge ports and have a higher priority than Layer 3 policies.

Note

Packets are checked by using the policy with the lowest index number first. If the packet matches the policy, the defined action will be taken and the remaining rules

will not be run for the packet. If the packet does not match the policy, the next policy will be used.

Limitations

You can configure up to 256 Layer 2 policies.

<input type="checkbox"/>	Status	Index	Event	Incoming Bridge Port	Outgoing Bridge Port	Ether Type	Source MAC	Destination MAC	Action
<input type="checkbox"/>	Enabled	1	Disabled/Emergency	Any BRG Members	Any BRG Members	Any	Any	Any	Accept

Max. 256 Items per page: 10 1 - 1 of 1 |< < > >|

APPLY

UI Setting	Description
Status	Shows whether the policy is enabled or disabled.
Index	Shows the index of the policy. The index determines the order for processing policies.
Event	Shows whether logging is enabled or disabled for the event and the severity assigned to the event.
Incoming Bridge Port	Shows the incoming bridge port for the policy.
Outgoing Bridge Port	Shows the outgoing bridge port for the policy.
Ether Type	Shows the EtherType that the policy applies to.
Source MAC	Shows the source MAC the policy applies to.
Destination MAC	Shows the destination MAC the policy applies to.
Action	Shows the action that will be taken for applicable traffic.

Add Layer 2 Policy

Menu Path: Firewall > Layer 2 Policy

Clicking the **Add (+)** icon on the **Firewall > Layer 2 Policy** page will open this dialog box. This dialog lets you create a new policy. Click **CREATE** to save your changes and add the new policy.

Delete Layer 2 Policy

Menu Path: Firewall > Layer 2 Policy

You can delete a policy by using the checkboxes to select the entries you want to delete, then clicking the **Delete** (🗑️) icon.

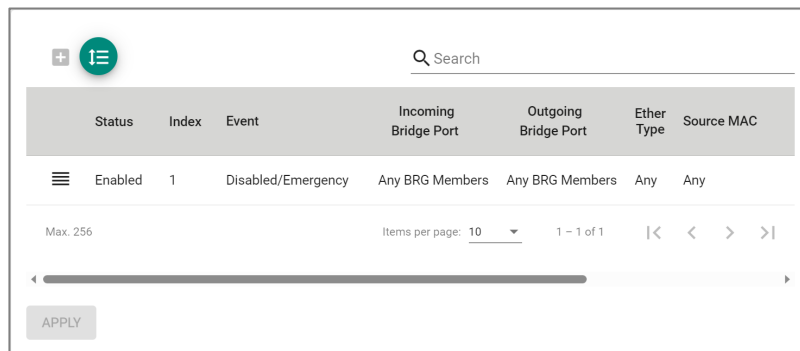

Reorder Layer 2 Policies

Menu Path: Firewall > Layer 2 Policy

You can reorder policies by clicking the **Reorder Priorities** (⌵) icon, moving the entries into the order you want, then clicking the **Reorder Priorities** (⌵) icon again.

Reordering policies affects the order used to process the policies.

Layer 3-7 Policy

Menu Path: Firewall > Layer 3-7 Policy

This page lets you configure Layer 3-7 policies to secure and control network traffic. Click **APPLY** to save your changes.

Note

Packets are checked by using the policy with the lowest index number first. If the packet matches the policy, the defined action will be taken and the remaining rules will not be run for the packet. If the packet does not match the policy, the next policy will be used.

Limitations

You can configure up to 1024 Layer 3-7 policies.

Source MAC Address (if Filter Mode is IP and Source MAC Binding or Source MAC Filtering)	<p>Specify the source MAC address this policy will apply to.</p>	Valid MAC address	N/A
Destination IP Address (if Filter Mode is IP and Port Filtering)	<p>Select the destination IP addresses this policy will apply to. Select Any to check all traffic going to any destination IP address, or select a pre-defined object. You can also click the Add (+) icon to create a new IP Address and Subnet object.</p> <p>Refer to Create Object for more information.</p>	Any / Drop-down list of IP Address and Subnet objects	Any

UI Setting	Description	Valid Range	Default Value
Destination Port or Protocol (if Filter Mode is IP and Port Filtering)	Select the destination ports or protocol this policy will apply to. Select Any to check all traffic going to any destination port or protocol, or select a pre-defined service or object. You can also click the Add (+) icon to create a new Network Service, Industrial Application Service, or User-defined Service object. Refer to Create Object for more information.	Any / Drop-down list of Network Service, Industrial Application Service, and port-based User-defined Service objects	Any

Delete Layer 3-7 Policy

Menu Path: Firewall > Layer 3-7 Policy

You can delete a policy by using the checkboxes to select the entries you want to delete, then clicking the **Delete** (🗑️) icon.

Reorder Layer 3-7 Policies

Menu Path: Firewall > Layer 3-7 Policy

You can reorder policies by clicking the **Reorder Priorities** (⌵) icon, moving the entries into the order you want, then clicking the **Reorder Priorities** (⌶) icon again. Reordering policies affects the order used to process the policies.

Index	Status	Name	Event	Incoming Interface	Outgoing Interface	Filter

Session Control

Menu Path: Firewall > Session Control

This page lets you configure session control policies to help protect backend hosts or services and avoid system abnormalities. Click **APPLY** to save your changes.

Note

If a TCP connection is successfully established, but no data is sent, the connection will be released after 8 seconds. If the interval between the last data transmission for the connection exceeds 300 seconds, the connection will also be released.

Limitations

You can configure up to 64 session control policies.

UI Setting	Description
Index	Shows the index of the policy. The index determines the order for processing policies.
Status	Shows whether the policy is enabled or disabled.
Name	Shows the name of the policy.
Destination IP	Shows the destination IP addresses the policy applies to.
Destination Port	Shows the destination ports the policy applies to.
Total TCP Connections	Shows the total number of TCP connections this policy allows.
Concurrent TCP Connections	Shows the number of concurrent TCP connections this policy allows.
Action	Shows the action that will be taken for applicable traffic.

Create Session Control Policy

Menu Path: Firewall > Session Control

Clicking the **Add (+)** icon on the **Firewall > Session Control** page will open this dialog box. This dialog lets you create a new policy. Click **CREATE** to save your changes and add the new policy.

Note

IP Address and **Port** cannot both be set to **Any**.

Note

At least one **TCP Connection Limitation** must be defined.

 **Note**

If Accept All LAN Port Connections is enabled in Trusted Access, Flood Protection will be disabled.

Refer to [Security > Device Security > Trusted Access](#) for more information.

Soft Lockdown Mode

Menu Path: Firewall > Soft Lockdown Mode

This page lets you configure Soft Lockdown Mode for your device. For more information on how this feature works, refer to [Soft Lockdown](#).

Note

Soft Lockdown Mode is a feature designed for railway applications and is only supported by the TN-4900 Series.

Note

In addition to the criteria defined in these settings, the device will enter Soft Lockdown Mode if any enabled critical service is no longer alive, and all enabled critical services must be alive to leave Soft Lockdown Mode.

The critical services that apply to Soft Lockdown Mode are as follows:

- DHCP Server (refer to [Network Service > DHCP Server](#))
- DHCP Relay Agent (refer to [Network Service > DHCP Server - DHCP Relay Agent](#))
- SNMP Server (refer to [SNMP](#))
- Turbo Ring V2 (refer to [Redundancy > Layer 2 Redundancy > Turbo Ring V2](#))

Note

If Soft Lockdown Mode and DHCP Server are both enabled, make sure at least one LAN interface's IP is within the DHCP server pool and at least one physical port is assigned to this LAN interface.

Advanced Protection

Menu Path: Firewall > Advanced Protection

This section lets you monitor and configure your device's advanced firewall features.

This section includes these pages:

- Dashboard
- Configuration
- Protocol Filter Policy
- ADP
- IPS

Dashboard

Menu Path: Firewall > Advanced Protection > Dashboard

This page lets you see an overview of your firewall's advanced protection activity with real-time event counters.

Note

Please note that available status displays may vary depending on the product and model, and whether an IPS license is installed or not.

Information

This display shows the versions of the installed firewall engines and security packages currently installed on the device, as well as whether various functions are enabled.

The screenshot shows an 'Information' panel with the following data:

Package Version	Package Updated Time	Enforcement	IPS
6.0.0016	2023-08-10 05:46:47	Enabled	Enabled

IPS Operation Mode
Prevention Mode

Engine Version

IPS	2.0.0005
IPS Pattern	1.0.0038
Modbus/TCP	23.7.0021

UI Setting

Description

Package Version

Shows the version of the current Network Security Package installed on the device.

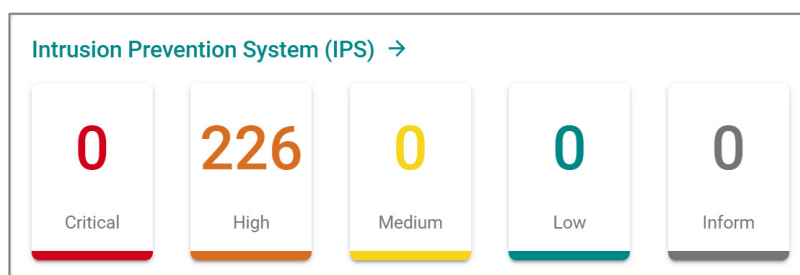

UI Setting	Description
Package Updated Time	Shows when the current Network Security Package was installed.
Enforcement	Shows whether Protocol Filtering is enabled.
IPS	Shows whether IPS is enabled.
IPS Operation Mode	Shows which operation mode IPS is using.
Engine Version	Shows the versions of the different engines being used.

Note

Starting from v9.0 of the Network Security Package, when the IPS license expires, existing IPS patterns can still be used for IPS protection. However, the IPS patterns will not be updated and will remain at their current versions when you update the Network Security Package.

Intrusion Prevention System (IPS)

This display shows the current number of Intrusion Prevention System (IPS) events. Clicking on an item will take you to a filtered view of the IPS event log. Refer to [Diagnostics > Event Logs and Notifications > Event Log - Firewall Log](#) for more information.

ADP

This display shows the current number of Anomaly Detection and Prevention (ADP) events. Clicking on an item will take you to the ADP event log. Refer to [Diagnostics > Event Logs and Notifications > Event Log - Firewall Log](#) for more information.

Enforcement

This display shows the current number of industrial protocol events. Clicking on an item will take you to a filtered view of the Protocol Filter Policy event log. Refer to [Diagnostics > Event Logs and Notifications > Event Log - Firewall Log](#) for more information.

Configuration

Menu Path: Firewall > Advanced Protection > Configuration

This page lets you configure your application firewall's advanced protection settings.

This page includes these tabs:

- Global Settings
- Protocol Filter Object
- Protocol Filter Profile

Configuration - Global Settings

Menu Path: Firewall > Advanced Protection > Configuration - Global Settings

This page lets you configure global settings for your application firewall's advanced protection features. You can also back up and restore your advanced protection settings on this page.

Backup/Restore

The screenshot shows a web interface for the Backup/Restore function. At the top, the title "Backup/Restore" is displayed. Below the title, there are three radio buttons: "Configuration" (which is selected), "Protocol Filter Policy", and "Debug Information". Underneath the radio buttons, there is a "Select File" label followed by a file selection icon. At the bottom of the interface, there are two buttons: a green "BACK UP" button and a grey "RESTORE" button.

UI Setting	Description	Valid Range	Default Value
Backup/Restore	<p>Select which settings you want to back up or restore. If you want to back up your settings, click BACK UP.</p> <p>Configuration: Back up/restore all settings on the Firewall > Advanced Protection > Configuration page.</p> <p>Protocol Filter Policy: Back up/restore all policies on the Firewall > Advanced Protection > Protocol Filter Policy page.</p> <p>Debug Information: Back up debug information for your firewall's advanced protection features.</p>	Configuration / Protocol Filter Policy / Debug Information	Configuration
Select File (if Backup/Restore is Configuration or Protocol Filter Policy)	If you want to restore settings, click this field and select the settings file from your local computer, then click RESTORE .	N/A	N/A

Global Settings

Note

Available settings will vary depending on your product model and whether an active IPS license is installed.

UI Setting

Description

Protocol Filter Object

Shows the name of the object

Category

Shows the protocol category of the object.

Protocol Filter Profile

Shows which protocol filter profile the object uses.

Protocol Filter Object - Create Object

Menu Path: Firewall > Advanced Protection > Configuration - Protocol Filter Object

Clicking the **Add (+)** icon on the **Firewall > Advanced Protection > Configuration - Protocol Filter Object** page will open this dialog box. This dialog lets you create a protocol filter object. Click **CREATE** to save your changes and add the new object.

Create Object - Modbus/TCP

If **Modbus/TCP** is selected for the **Category**, these settings will appear.

The screenshot shows a 'Create Object' dialog box with the following fields and values:

- Name ***: Text input field, value: 0 / 64
- Category ***: Dropdown menu, value: Modbus/TCP
- Slave ID**: Text input field, value: Any
- Protocol Filter Profile ***: Dropdown menu, value: Manual
- Function Code ***: Dropdown menu, value: 1
- PLC Address Base 1 ***: Dropdown menu, value: Enabled
- Filter Type ***: Dropdown menu, value: Data Value
- Start Address ***: Text input field, value: 0 - 65535 or 0x0000 - 0xFFFF
- Value ***: Text input field, value: 0 or 1

At the bottom right, there are two buttons: **CANCEL** and **CREATE**.

UI Setting	Description	Valid Range	Default Value
Name	Specify a name for the object.	1 to 64 characters	N/A
Category	Select a protocol for this object.	Modbus/TCP / DNP3 / MMS / IEC-104 / EIP / Omron FINS / Step7Comm / TRDP	N/A
	 Note Available settings will vary depending on your product model.		
Slave ID	Specify the Modbus slave ID. Leave this field blank to represent any ID. The Slave ID is used to identify Modbus devices. This ID can be used to communicate via devices such as bridges and gateways which use a single IP address to support multiple independent end units.	0 to 255 / 0x00 to 0xFF	Any
Protocol Filter Profile	Select preset protocol filter profile or a user-configured protocol filter profile to use for this protocol filter object. Read Only: Use a set of commonly used function codes associated with read-only access. Write Only: Use a set of commonly used function codes associated with write-only access. Read/Write: Use a set of commonly used function codes associated with read/write access. Manual: Manually enter the settings for this object. Refer to Firewall > Advanced Protection > Configuration - Protocol Filter Profile for more information on creating protocol filter profiles.	Read Only / Write Only / Read/Write / Drop-down list of related protocol filter profiles / Manual	N/A
Function Code	Shows which function codes will be used for the object, based on the selected Protocol Filter Profile . If Manual is selected for the Protocol Filter Profile , select which function codes to use for this object. You can select multiple options.	Drop-down list of function codes	Depends on the selected Protocol Filter Profile

UI Setting	Description	Valid Range	Default Value
PLC Address Base 1 (if only one Function Code is selected)	Select whether the PLC's starting address should start from 0x00 or 0x01. This should be set based on your PLCs to ensure DPI filters the correct addresses and values. Enabled: The PLC's starting address starts at 0x01. Disabled: The PLC's starting address starts at 0x00.	Enabled / Disabled	Disabled
Filter Type (if only one Function Code is selected)	Select the filter type to use. None: Filter traffic by specified function codes. Address Range: Filter traffic by specified PLC register addresses. Data Value: Filter the traffic by specified data values in the registers.	None / Address Range / Data Value	None
Address Range (if Filter Type is Address Range)	Define the address range to use for the filter. You can enter the address range in decimal or hexadecimal format.	0 to 65535 / 0x0000 to 0xFFFF	N/A
Start Address (if Filter Type is Data Value)	Specify the starting address for the PLC register address. You can enter the addresss in decimal or hexadecimal format.	0 to 65535 / 0x0000 to 0xFFFF	N/A
Value (if Filter Type is Data Value)	Specify a data value to filter for. You can enter up to 16 bits (2 bytes) of binary data for the data value.	0 to 1111111111111111 (binary data)	N/A

Protocol Filter Profile

Menu Path: [Firewall > Advanced Protection > Configuration - Protocol Filter Profile](#)

This page lets you create and manage protocol filter profiles to simplify maintaining protocol-related settings. Protocol filter profiles can be used when creating protocol filter objects, and a single profile can be used in multiple protocol filter objects.

Note

Available protocols may vary across different product models and versions.

Limitations

You can create up to 50 protocol filter profiles.

<input type="checkbox"/>	Protocol Filter Profile	Category

Protocol Filter Policy

Menu Path: Firewall > Advanced Protection > Protocol Filter Policy

This page lets you manage your application firewall's protocol filtering policies, which allow you to inspect industrial protocol packets. This allows you to control protocol traffic based on the configured protocol filter policies and Anomaly Detection and Protection (ADP) settings.

Refer to [ADP](#) for more information.

Note

Before creating protocol filter policies, you will need to set up protocol filter objects to define what application protocols your policies will apply to.

Refer to [Firewall > Configuration - Protocol Filter Object](#) for more information.

Limitations

You can create up to 200 protocol filter policies.

Protocol Filter Policy

UI Setting	Description	Valid Range	Default Value
Index	Specify the index of the policy.	1-200	1
Policy Name	Specify a name for the policy.	1 to 64 characters	N/A
Status	Enable or disable the policy.	Enabled / Disabled	Disabled

UI Setting	Description	Valid Range	Default Value
From Interface	Select the From Interface for the policy. <div style="border: 1px solid #ccc; background-color: #f9f9f9; padding: 10px;"> <p> Note</p> <p>Available interfaces will vary depending on your product model and configuration. Refer to Network Configuration > Network Interfaces for more information about managing your device's interfaces.</p> </div>	Any / Drop-down of interfaces	Any
To Interface	Select the To Interface for the policy. <div style="border: 1px solid #ccc; background-color: #f9f9f9; padding: 10px;"> <p> Note</p> <p>Available interfaces will vary depending on your product model and configuration. Refer to Network Configuration > Network Interfaces for more information about managing your device's interfaces.</p> </div>	Any / Drop-down of interfaces	Any
Source IP	Select how the policy will check the packet's source IP address. Any: The policy will check all source IP addresses in the packet. Single: The policy will only check for the specified source IP address in the packet. Range: The policy will check all source IP addresses in the packet within the specified IP range. Subnet: The policy will check for source IP addresses in the packet that are within the specified subnet mask.	Any / Single / Range / Subnet	Any
Destination IP	To decide how the policy will check the packet's destination IP address. Any: The policy will check all destination IP addresses in the packet. Single: The policy will only check for the specified destination IP address in the packet. Range: The policy will check all destination IP addresses in the packet within the specified IP range. Subnet: The policy will check for destination IP addresses in the packet that are within the specified subnet mask.	Any / Single / Range / Subne	Any
Protocol	Select the protocol for this policy.	Any / TCP / UDP	Any
Command Type	Select the packet transmission direction for this policy.	Master Query / Slave Response	Master Query

UI Setting	Description	Valid Range	Default Value
Application Protocol	Select the protocol filter object to use to define the application protocol for this policy. Refer to Firewall > Advanced Protection > Configuration - Protocol Filter Object for more information.	Custom object	N/A
Action	Select the action to take for packets that match the policy. Accept: The firewall will accept packets that match the policy. Monitor: The firewall will monitor packets that match the policy. With this setting, each packet of an identified application protocol will have a corresponding Event Log entry. Reset: The firewall will drop packets that match the policy, and the session will be disconnected. With this setting, only the first packet of an identified application protocol will be recorded in Event Log.	Accept / Monitor / Reset	Accept

ADP

Menu Path: Firewall > Advanced Protection > ADP

This page lets you configure your device's Anomaly Detection and Protection (ADP) parameters.

Note

Availability of this feature may vary depending on your product model and version.

IPS

Menu Path: Firewall > Advanced Protection > IPS

This page lets you configure the Intrusion Prevention System (IPS) feature, which helps protect against cyberthreats by performing pattern-based detection and blocking known attacks.

Note

Availability of this feature may vary depending on your product model and version.

Note

A separate IPS license is required to enable IPS functionality on the device.

Note

Starting from v9.0 of the Network Security Package, when the IPS license expires, existing IPS patterns can still be used for IPS protection. However, the IPS patterns will not be updated and will remain at their current versions when you update the Network Security Package.

Detailed Information

Menu Path: Firewall > Advanced Protection > IPS

Clicking the **Detailed Information (🔍)** icon for a rule on the **Firewall > Advanced Protection > IPS** page will toggle display of a panel with detailed information about the rule.

The screenshot shows the 'Intrusion Prevention System' interface. A table lists several rules, including 'ICMP Flood' (ID 4026531844). A red box highlights the 'Detailed Information' icon for this rule. To the right, a panel titled 'IPS Rule Information' is open, displaying the following details for the 'ICMP Flood' rule:

- Category: Flooding&Scan
- Severity: High
- Impact: Denial of service
- Reference: MISC-RFC 792
- Description: An ICMP attack can come in many forms. There are 2 basic kinds, Flood and Nuke. An ICMP flood is usually accomplished by broadcasting either a bunch of ICMP ping packets (not to be confused with IRC pings, which have a similar purpose, but are handled differently) or UDP packets (which are used in software like PointCast). The idea is, to send excessive data to the system, so that it gets slowed down to the point of being disconnected from IRC due to a ping timeout.

Edit IPS Rule Action

Menu Path: Firewall > Advanced Protection > IPS

Clicking the **Edit (✎)** icon for an ITEM on the **Firewall > Advanced Protection > IPS** page will open this dialog box. This dialog lets you modify an IPS rule. Click **APPLY** to save your changes.

VPN

Menu Path: VPN

The VPN settings area lets you configure settings related to your device's VPN functionality.

This settings area includes these sections:

- IPsec
- L2TP Server

VPN - User Privileges

Privileges to VPN settings are granted to the different authority levels as follows. Refer to [System > Account Management > User Accounts](#) for more information on user accounts.

Settings	Admin	Supervisor	User
IPsec	R/W	R/W	R
L2TP Server	R/W	R/W	R

IPSec

Menu Path: VPN > IPSec

This page lets you set up IPsec VPN tunnels for your device.

This page includes these tabs:

- Global Settings
- IPsec Settings
- IPsec Status

Global Settings

Menu Path: VPN > IPSec - Global Settings

This page lets you configure global settings that affect all IPsec tunnels.

IPSec Settings

Menu Path: VPN > IPSec - IPSec Settings

This page lets you create and edit IPSec VPN tunnels for your device.

UI Setting	Description
Status	Shows whether the tunnel is enabled or disabled.
Name	Shows the name of the tunnel.
Remote VPN Gateway	Shows the IP address of the remote VPN gateway for the tunnel.
Local Network	Shows the tunnel's local network IP address.
Remote Network	Shows the tunnel's remote network IP address.

Create IPSec

Menu Path: VPN > IPSec - IPSec Settings

Clicking the **Add** () icon on the **VPN > IPSec - IPSec Settings** page will open this dialog box. This dialog lets you create a new IPSec VPN tunnel. Click **CREATE** to save your changes and add the new tunnel.

Create IPSec - Quick Settings

If **Quick Settings** is selected, these settings will appear.

Tunnel Settings

UI Setting	Description	Valid Range	Default Value
Status	Enable or disable the tunnel.	Enabled / Disabled	Enabled
Name	Enter a name for this tunnel.	Max. 31 characters	N/A
	<p> Note</p> <p>Names must start with a character that is not a number.</p>		
VPN Connection	Select the type of VPN connection to use for this rule. Site to Site: The VPN tunnel for the Local and Remote subnets is fixed. Site to Site(Any): The VPN tunnel for the Remote subnet area is dynamic and is fixed for the Local subnet.	Site to Site / Site to Site(Any)	Site to Site

UI Setting	Description	Valid Range	Default Value
Remote VPN Gateway	Specify the IP address of the remote VPN gateway. If VPN Connection is set to Site to Site(Any) , this does not need to be set.	Valid IP address	N/A

Remote Network List

You can configure multiple remote networks for the tunnel. Click the add icon () to add a new entry. Select an entry and click the delete icon () to delete it.

Limitations

You can add up to 10 remote networks for an IPsec VPN tunnel.

UI Setting	Description	Valid Range	Default Value
Remote Network	Specify the IP address and subnet mask of the remote VPN network.	Valid IP address	N/A
Netmask	Select a netmask to use for the remote network.	Drop-down list of netmasks	24 (255.255.255.0)

Security Settings

UI Setting	Description	Valid Range	Default Value
Security Strength	<p>Select the security strength for the tunnel. Different settings will change the Encryption Algorithm and Hash Algorithm used, which can be viewed in Advanced Settings.</p> <p>Simple: Uses DES for the Encryption Algorithm and MD5 for the Hash Algorithm.</p> <p>Standard: Uses 3DES for the Encryption Algorithm and SHA-1 for the Hash Algorithm.</p> <p>Strong: Uses AES-256 for the Encryption Algorithm and SHA-256 for the Hash Algorithm.</p>	Simple / Standard / Strong	Strong

UI Setting	Description	Valid Range	Default Value
Authentication Mode	<p>Select the authentication mode to use for the tunnel.</p> <div style="border: 1px solid #ccc; background-color: #f9f9f9; padding: 10px; margin: 10px 0;"> <p> Note</p> <p>You must have certificates already imported to select X.509 or X.509 With CA. Refer to Certificate Management for more information.</p> </div> <p>Pre-Shared Key: Pre-Shared Key is a user-defined authentication string used by two systems to establish an IPsec VPN connection.</p> <p>X.509: The local and remote systems will authenticate the VPN connection using certificates imported in advance by the user on the Certificate Management > Local Certificate page.</p> <p>X.509 With CA: The local and remote systems will authenticate the VPN connection using both certificates imported in advance by the user on the Certificate Management > Local Certificate page and a CA certificate imported on the Certificate Management > Trusted CA Certificate page.</p>	Pre-Shared Key / X.509 / X.509 With CA	Pre-Shared Key
Pre-Shared Key	Specify a pre-shared key to use to authenticate the IPsec VPN connection.	0 to 64 characters	N/A

UI Setting	Description	Valid Range	Default Value
Name	Enter a name for this tunnel.	Max. 31 characters	N/A
	<p> Note</p> <p>Names must start with a character that is not a number.</p>		
L2TP Tunnel	Enable or disable L2TP over IPSec.	Enabled / Disabled	Disabled
VPN Connection	Select the type of VPN connection to use for this rule. Site to Site: The VPN tunnel for the Local and Remote subnets is fixed. Site to Site(Any): The VPN tunnel for the Remote subnet area is dynamic and is fixed for the Local subnet.	Site to Site / Site to Site(Any)	Site to Site
Remote VPN Gateway	Specify the IP address of the remote VPN gateway. If VPN Connection is set to Site to Site(Any) , this does not need to be set.	Valid IP address	N/A
Startup Mode	Select a startup mode for the tunnel. Start in Initial: The VPN tunnel will actively initiate the connection with the remote VPN gateway. Wait for Connecting: The VPN tunnel will wait for the remote VPN gateway to initiate the connection.	Start in Initial / Wait for Connecting	Start in Initial
	<p> Note</p> <p>The maximum number of waits for connecting to a VPN tunnel is 100.</p>		

Local Network List

You can configure multiple local networks for the tunnel. Click the add icon () to add a new entry. Select an entry and click the delete icon () to delete it.

Limitations

You can add up to 10 local networks for an IPSec VPN tunnel.

UI Setting	Description	Valid Range	Default Value
Local Network	Specify the IP address and subnet mask of the local VPN network.	Valid IP address	N/A
Netmask	Select a netmask to use for the local network.	Drop-down list of netmasks	24 (255.255.255.0)

Remote Network List

You can configure multiple remote networks for the tunnel. Click the add icon () to add a new entry. Select an entry and click the delete icon () to delete it.

Limitations

You can add up to 10 remote networks for an IPsec VPN tunnel.

UI Setting	Description	Valid Range	Default Value
Remote Network	Specify the IP address and subnet mask of the remote VPN network.	Valid IP address	N/A
Netmask	Select a netmask to use for the remote network.	Drop-down list of netmasks	24 (255.255.255.0)

Identity

UI Setting	Description	Valid Range	Default Value
Identity Type	Select an ID type to use to identify VPN tunnel connections. IP Address: Use an IP address. FQDN: Use a Fully Qualified Domain Name (FQDN). Key ID: Use a user-defined key ID string. Auto(with Cisco): Use this when establishing connections to Cisco systems.	IP Address / FQDN / Key ID / Auto(with Cisco)	IP Address
Local ID (If Identity Type is IP Address, FQDN, or Key ID)	Specify the local ID for identifying the VPN tunnel connection. The Local ID must be identical to the Remote ID of the connected VPN gateway in order to successfully establish the VPN tunnel connection.	1 to 31 characters	N/A

UI Setting	Description	Valid Range	Default Value
Remote ID (If Identity Type is IP Address, FQDN, or Key ID)	Specify the remote ID for identifying the VPN tunnel connection. The Remote ID must be identical to the Local ID of the connected VPN gateway in order to successfully establish the VPN tunnel connection.	1 to 31 characters	N/A

Key Exchange (Phase 1)

UI Setting	Description	Valid Range	Default Value
IKE Mode	Select the IKE mode to use for authentication. Main: Both the remote and local VPN gateway will negotiate which encryption/hash algorithm and DH groups can be used for this VPN tunnel. Both VPN gateways must use the same algorithm to communicate. Aggressive: The remote and local VPN gateways will not negotiate the algorithm and will only use the user-defined configuration.	Main / Aggressive	Main
IKE Version	Select which version of IKE to use. IKE1: Use IKE Version 1 protocol. IKE2: Use IKE Version 2 protocol.	IKE1 / IKE2	IKE2

UI Setting	Description	Valid Range	Default Value
Authentication Mode	Select the authentication mode to use for the tunnel.	Pre-Shared Key / X.509 / X.509 With CA	Pre-Shared Key
	<div style="border: 1px solid #ccc; background-color: #f9f9f9; padding: 10px; margin-bottom: 10px;"> <p> Note</p> <p>You must have certificates already imported to select X.509 or X.509 With CA. Refer to Certificate Management for more information.</p> </div> <p>Pre-Shared Key: Pre-Shared Key is a user-defined authentication string used by two systems to establish an IPsec VPN connection.</p> <p>X.509: The local and remote systems will authenticate the VPN connection using certificates imported in advance by the user on the Certificate Management > Local Certificate page.</p> <p>X.509 With CA: The local and remote systems will authenticate the VPN connection using both certificates imported in advance by the user on the Certificate Management > Local Certificate page and a CA certificate imported on the Certificate Management > Trusted CA Certificate page.</p>		
Pre-Shared Key	Specify a pre-shared key to use to authenticate the IPsec VPN connection.	0 to 64 characters	
Encryption Algorithm	Select the encryption algorithm to use for key exchange.	DES / 3DES / AES-128 / AES-192 / AES-256	AES-256
Hash Algorithm	Select the hash algorithm to use for key exchange.	MD5 / SHA-1 / SHA-256	SHA-256
DH Group	Select the Diffie-Hellman group. This is the key exchange group between the remote and VPN gateways.	DH 1(modp768) / DH 2(modp1024) / DH 5(modp1536) / DH 14(modp2048)	DH 14(modp2048)
IKE Lifetime	Specify the lifetime (in minutes) for IKE SA.	30 to 43200	43200

Data Exchange (Phase 2)

UI Setting	Description	Valid Range	Default Value
Encryption Algorithm	Select the encryption algorithm to use for data exchange.	DES / 3DES / AES-128 / AES-192 / AES-256	AES-256
Hash Algorithm	Select the hash algorithm to use for data exchange.	MD5 / SHA-1 / SHA-256	SHA-256
Perfect Forward Secrecy	Enable or disable Perfect Forward Secrecy. When enabled, different security keys are used for different IPsec phases in order to enhance security.	Enabled / Disabled	Disabled
DH Group	Select the Diffie-Hellman group. This is the Key Exchange group between the remote and VPN gateways.	DH 1 (modp768), DH 2 (modp1024), DH 5 (modp1536), DH 14 (modp2048)	DH 14 (modp2048)
SA Lifetime	Specify the lifetime (in minutes) for Phase 2 IKE SA.	30 to 43200	43200

Dead Peer Detection

UI Setting	Description	Valid Range	Default Value
Action	Specify the action the system should take when a dead peer is detected. Hold: Maintain the VPN tunnel. Restart: Reconnect the VPN tunnel. Clear: Clear the VPN tunnel. Disabled: Disable Dead Peer Detection.	Hold / Restart / Clear / Disabled	Restart
Retry Interval	Specify the interval (in seconds) at which Dead Peer Detection messages are sent.	0 to 3600	30
Confidence Interval	Specify the interval (in seconds) at which the system will check to see if the connection is alive or not.	0 to 3600	120

IPSec Status

Menu Path: VPN > IPSec - IPSec Status

This page lets you see the status of your IPSec VPN tunnels.

Name	Local Network	Local Gateway	Remote Network	Remote Gateway	Key Exchange (Phase 1)	Data Exchange (Phase 2)	Time
test1	192.168.127.254/24	10.123.13.33	192.168.127.1/24	10.1.1.2			0h:0m:0s

UI Setting	Description
Name	Shows the name of the tunnel.
Local Network	Shows the local network address for the tunnel.
Local Gateway	Shows the local gateway address for the tunnel.
Remote Network	Shows the remote network address for the tunnel.
Remote Gateway	Shows the remote gateway address for the tunnel.
Key Exchange (Phase 1)	Shows the status of key exchange phase.
Data Exchange (Phase 2)	Shows the status of the data exchange phase.
Time	Shows how long the connection has been up.

L2TP Server

Menu Path: VPN > L2TP Server

This page lets you configure the L2TP server function of your device. L2TP is a popular choice for VPN applications with remote roaming users since an L2TP client is built into the Microsoft Windows operating system. Since L2TP does not provide any encryption, it is usually combined with IPsec to provide data encryption.

This page includes these tabs:

- Server Setting (WAN)
- User Name Settings

Server Setting (WAN)

Menu Path: VPN > L2TP Server - Server Setting (WAN)

This page lets you enable and configure the L2TP server function of your device.

UI Setting	Description	Valid Range	Default Value
L2TP Server Mode	Enable or disable the L2TP server.	Enabled / Disabled	Disabled
Local IP	Specify the IP address of the local subnet.	Valid IP address	0.0.0.0
Offered IP: Start	Specify the starting IP address of the offered IP range used for L2TP clients.	Valid IP address	0.0.0.0
Offered IP: End	Specify the ending IP address of the offered IP range used for L2TP clients.	Valid IP address	0.0.0.0

User Name Settings

Menu Path: VPN > L2TP Server - User Name Settings

This page lets you manage users that can connect to your device's L2TP server.

Limitations

You can add up to 10 users for the L2TP Server.

UI Setting	Description
User Name	Shows the name of the user account.

Create New Account for L2TP

Menu Path: VPN > L2TP Server - User Name Settings

Clicking the **Add (+)** icon on the **VPN > L2TP Server - User Name Settings** page will open this dialog box. This dialog lets you create a new user account for the device's L2TP server. Click **CREATE** to save your changes and add the new account.

Certificate Management

Menu Path: Certificate Management

The Certificate Management settings area lets you manage X.509 digital certificates for your device. These certificates are commonly used for IPsec, OpenVPN, and HTTPS authentication. This device can act as a root CA (Certificate Authority) and issue a

trusted root certificate. Alternatively, you can import certificates from other CAs.

Certificates are a time-based form of authentication. Before processing certificates, please ensure that your device is synced with the local device. For more information about syncing device time, please refer to [System > Time](#).

This section includes these pages:

- Local Certificate
- Trusted CA Certificate
- Certificate Signing Request

⚠ Warning

For security reasons, if the device is deployed without a CA server environment, we strongly recommend using short lifetime certificates (e.g., 24 hours) to ensure system security.

⚠ Warning

Because the device's default signature certificates are manufactured without third-party signatures, there is a potential risk of man-in-the-middle attacks that impersonate services, with the client-side being unable to verify.

Therefore, we recommend that upon activating the device, you use the [Certificate Management > Local Certificate](#) feature to add or update the certificate to one that belongs to your company and that is issued by a recognized certification authority in order to ensure the security and trustworthiness of your network communications.

Certificate Management - User Privileges

Privileges to Certificate Management settings are granted to the different authority levels as follows. Refer to [System > Account Management > User Accounts](#) for more

information on user accounts.

Settings	Admin	Supervisor	User
Local Certificate	R/W	-	-
Trusted CA Certificate	R/W	-	-
Certificate Signing Request	R/W	-	-

Local Certificate

Menu Path: Certificate Management > Local Certificate

This page lets you import and manage X.509 digital certificates.

Limitations

You can import up to 10 local certificates.

<input type="checkbox"/> Label	Issued To	Issued By	Expiration Date	Key Length
Max. 10		0 of 0		

UI Setting	Description
Label	Shows the label identifying the certificate.
Issued To	Shows who the certificate was issued to.
Issued By	Shows who the certificate was issued by.
Expiration Date	Shows the expiration date of the certificate.
Key Length	Shows the key length of the certificate.

Generate Certificate

Menu Path: Certificate Management > Local Certificate

Clicking the **Add (+)** icon on the **Certificate Management > Local Certificate** page will open this dialog box. This dialog lets you import a certificate from your local computer. Click **UPGRADE** to save your changes and add the new certificate.

UI Setting	Description	Valid Range	Default Value

Certificate Signing Request

Menu Path: Certificate Management > Certificate Signing Request

This page lets you generate and manage key pairs and certificate signing requests (CSRs). Certificate signing requests are needed to apply for and import a digital identity certificate from a CA.

To get a certificate from a CA for connection purposes, you will need to:

1. Generate a key pair
2. Generate a CSR

This page includes these tabs:

- Key Pair Generate
- CSR Generate

Key Pair Generate

Menu Path: Certificate Management > Certificate Signing Request - Key Pair Generate

This page lets you generate and manage key pairs, which are used to generate CSRs.

Limitations

You can generate up to 10 key pairs.

UI Setting

Description

Name

Shows the name of the RSA key.

Key Pair Size

Shows the size used for the key pair.

Generate RSA Key

Menu Path: Certificate Management > Certificate Signing Request - Key Pair Generate

Clicking the **Add** () icon on the **Certificate Management > Certificate Signing Request - Key Pair Generate** page will open this dialog box. This dialog lets you generate a new key pair to use when generating a CSR. Click **GENERATE** to save your changes and add the new key pair.

Server IP Address 2 0.0.0.0	TCP Port * 49 1 - 65535
Share Key 0 / 64	 
Auth Type * CHAP	
Timeout * 5 5 - 180 sec.	
Retry * 1 0 - 5 times	

APPLY

UI Setting	Description	Valid Range	Default Value
Server IP Address 1	Specify the IPv4 address of the primary TACACS+ server to use. Setting the address to 0.0.0.0 will disable use of a primary TACACS+ server. When authenticating a remote user, the device will try to authenticate them using the primary server specified by Server IP Address 1 . If the device fails to connect to the primary server, it will try to authenticate by using the secondary server specified by Server IP Address 2 .	Valid IP address	0.0.0.0
TCP Port	Specify the TCP port to use for authentication requests to the primary TACACS+ server.	1 to 65535	49
Shared Key	Specify the shared encryption key for the primary TACACS+ server.	1 to 64 characters	N/A
Auth Type	Specify which authentication type the primary TACACS+ server uses.	PAP, CHAP, ASCII	CHAP
Timeout	Specify the amount of time in seconds a client will wait for a response from the primary TACACS+ server before re-transmitting the request.	5 to 120 (sec)	5
Retry	Specify the number of times the device will try to contact the primary TACACS+ server.	0 to 5	1
Server IP Address2	Specify the IPv4 address of the secondary TACACS+ server to use. Setting the address to 0.0.0.0 will disable use of a secondary TACACS+ server.	Valid IP address	0.0.0.0
TCP Port	Specify the TCP port to use for authentication requests to the secondary TACACS+ server.	1 to 65535	49
Shared Key	Specify the shared encryption key for the secondary TACACS+ server.	1 to 64 characters	N/A
Auth Type	Specify which authentication type the secondary TACACS+ server uses.	PAP, CHAP, ASCII	CHAP
Time out	Specify the amount of time in seconds a client will wait for a response from the secondary TACACS+ server before re-transmitting the request.	5 to 120 (sec)	5
Retry	Specify the number of times the device will try to contact the secondary TACACS+ server.	0 to 5	1

MXview Alert Notification

Menu Path: Security > MXview Alert Notification

This page lets you configure device notifications for MXview.

This page includes these tabs:

- Security Notification Setting
- Security Status

Security Notification Setting

Menu Path: Security > MXview Alert Notification - Security Notification Setting

This page lets you configure your MXview security alert notification settings.

Note

Notifications are handled by the SNMP Trap function, which should be configured in advance. Refer to [Diagnostics > Event Logs and Notifications > SNMP Trap/Inform](#) for more information.

In MXview, go to **Preferences > Server > SNMP Trap Server** and make sure the matching SNMP version is selected.

Login Fail Event Notification *

APPLY

UI Setting	Description	Valid Range	Default Value
Firewall Event Notification	Enable or disable notifications for Firewall events.	Enabled / Disabled	Disabled
	<p> Note</p> <p>After enabling this, you will need to enable logging and select Trap as the log destination for each firewall policy and feature you want notifications for.</p>		
DoS Attack Event Notification	Enable or disable notifications for DoS attack events.	Enabled / Disabled	Disabled
	<p> Note</p> <p>After enabling this, you will need to go to Firewall > DoS Policy to enable logging and select Trap as the log destination to receive notifications.</p>		
Access Violation Event Notification	Enable or disable notifications for Access Violation events.	Enabled / Disabled	Disabled
	<p> Note</p> <p>After enabling this, you will need to go to Security > Device Security > Trusted Access to enable logging and select Trap as the log destination to receive notifications.</p>		

UI Setting	Description	Valid Range	Default Value
Login Fail Event Notification	Enable or disable notifications for Login Fail events.	Enabled / Disabled	Disabled
<div style="border: 1px solid #ccc; padding: 10px; background-color: #f9f9f9;"> <p> Note</p> <p>After enabling this, you will need to go to Diagnostics > Event Logs and Notifications > Event Notifications to enable logging and select Trap as the log destination to receive notifications.</p> </div>			

Security Status

Menu Path: Security > MXview Alert Notification - Security Status

This page lets you see the status of all MXview security event types.

Clicking the **Reset** () icon will clear the status of all events to default (**safe**).

Event	Status
Firewall	safe
DoS Attack	safe
Access Violation	safe
Login Fail	safe

Max. 10 Items per page: 50 1 - 4 of 4 < < > >

UI Setting	Description
Event	Shows the name of the event type.

UI Setting	Description
Status	Shows the current status of the event type. safe: No event of this type has been detected. attacked: An event of this type was detected.

Diagnostics

Menu Path: Diagnostics

The Diagnostics settings area lets you keep track of system and network performance, check event logs, and check the status of the port connectors.

This settings area includes these sections:

- System Status
- Network Status
- Event Logs and Notifications
- Tools

Diagnostics - User Privileges

Privileges to Diagnostics settings are granted to the different authority levels as follows. Refer to [System > Account Management > User Accounts](#) for more information on user accounts.

Settings	Admin	Supervisor	User
System Status			
Utilization	R/W	R/W	R
Fiber Check	R/W	R/W	R
Network Status			

Settings	Admin	Supervisor	User
Network Statistics	R	R	R

Email Settings	R/W	R	R
Tools			
Port Mirror	R/W	R/W	R
Ping	R/W	R/W	R

System Status

Menu Path: [Diagnostics > System Status](#)

This section lets you check on various system statuses.

This section includes these pages:

- Utilization
- Fiber Check

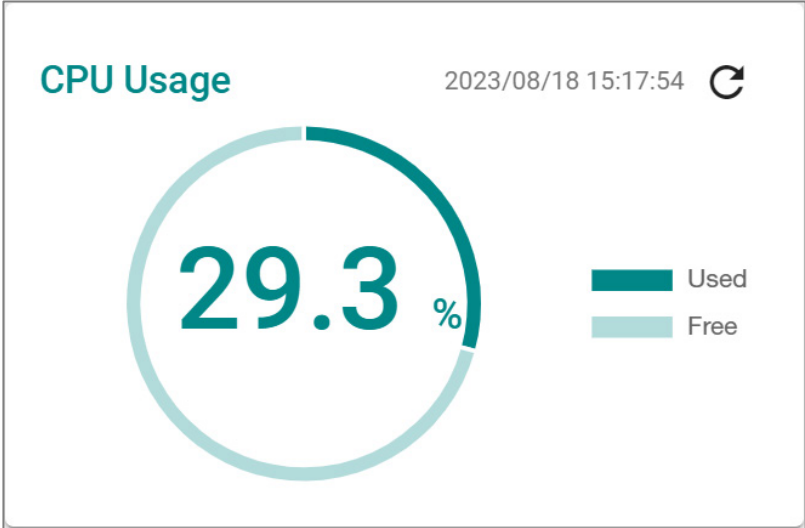

Utilization

Menu Path: [Diagnostics > System Status > Utilization](#)

This page lets you monitor current and historical system resource utilization.

CPU Usage

This shows the current CPU usage of your device.

CPU Usage History

This shows the CPU usage of your device over time.

Memory Usage

This shows your device's current memory usage.

Memory Usage History

This shows your device's memory usage over time.

Fiber Check

Menu Path: [Diagnostics](#) > [System Status](#) > [Fiber Check](#)

This page lets you diagnose the link status of the device's fiber connectors, including SFP and fixed type (multi-mode SC/ST and single-mode SC) connectors. It lets you monitor the temperature, TX/RX power, and other parameters on fiber ports to determine if the ports are working properly.

You can enable trap, email warning, and/or relay warning functions to receive an alarm or relay if one of the fiber ports exceeds the threshold for that port. Refer to [Diagnostics > Event Logs and Notifications](#) for more information.

Fiber Check Settings

UI Setting	Description	Valid Range	Default Value
Fiber Check	Enable or disable the fiber check feature.	Enabled / Disabled	Disabled

Fiber Check Status List

UI Setting	Description
Port	Shows the port number of the fiber connection.
Model Name	Shows the name of the related SFP module.
SN	Shows the serial number of the related SFP module.
Wavelength (nm)	Shows the wavelength of the fiber connection.
VccV	Shows the voltage supplied to the fiber connection.
Current Temperature (°C)	Shows the current temperature of the fiber connection.
Max. Temperature (°C)	Shows the maximum temperature the fiber connection supports.
Current TX Power(dBm)	Shows the current transmit signal strength for the fiber connection.
Max./Min. TX Power(dBm)	Shows the maximum and minimum transmit signal strength for the fiber connection.
Current RX Power(dBm)	Shows the current receive signal strength for the fiber connection.
Min. RX Power(dBm)	Shows the minimum receive signal strength for the fiber connection.

Network Status

Menu Path: [Diagnostics](#) > [Network Status](#)

This section lets you check on the status of your device's network connections.

This section includes these pages:

- Network Statistics
- LLDP
- ARP Table

Network Statistics

Menu Path: [Diagnostics](#) > [Network Status](#) > [Network Statistics](#)

This page lets you see the real-time packet and bandwidth status for your device.

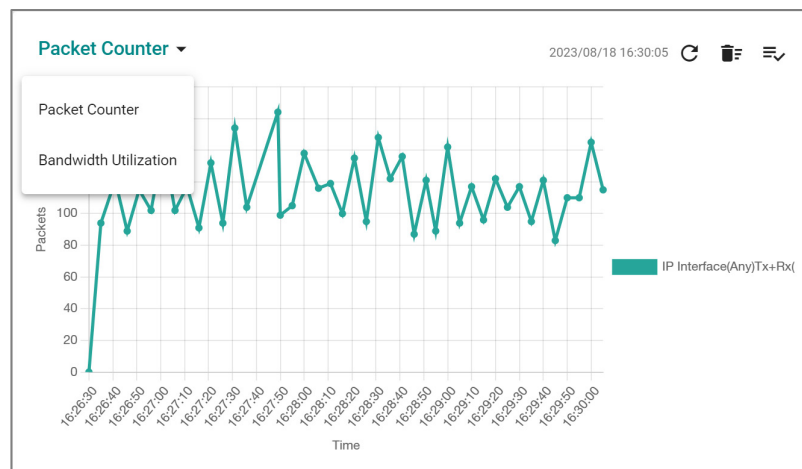

Network Status Display

This display lets you switch between **Packet Counter** and **Bandwidth Utilization** views by clicking on the drop-down menu.

- **Packet Counter:** This view shows how many packets are being handled over time. This view updates every 5 seconds.
- **Bandwidth Utilization:** This view shows bandwidth utilization over time. This view updates every 3 seconds.

Note

The default line shows activity for all IP interfaces for both Tx and Rx activity. You can add additional lines by clicking the **Display Settings** button.

UI Setting	Description
Refresh ()	Updates statistics immediately without waiting for the refresh interval.
Reset Statistics Graph ()	Clears the display and resets display settings back to defaults.
Display Settings ()	Opens Display Settings , which allows you to add lines based on user-defined criteria.

Display Settings

Menu Path: Diagnostics > Network Status > Network Statistics

Clicking the **Display Settings** (☰) icon on the **Diagnostics > Network Status > Network Statistics** page will open this dialog box. This dialog lets you define additional interfaces or ports to monitor. Click **ADD** to save your changes and add the new line.

1 - 4 of 4

LLDP Settings

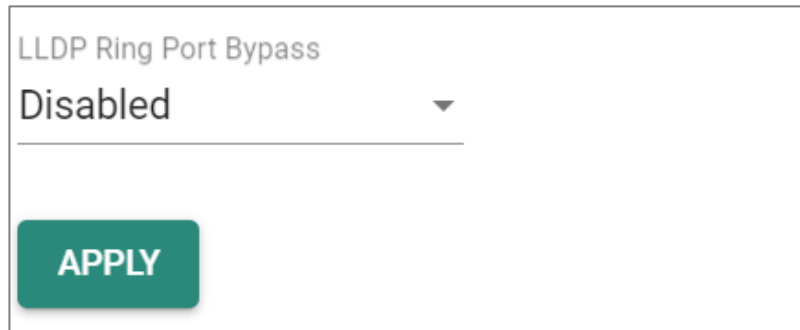

Menu Path: Diagnostics > Network Status > LLDP

This page lets you configure Link Layer Discovery Protocol (LLDP) settings.

LLDP Settings

The screenshot shows the LLDP configuration interface. At the top, there is a header 'LLDP' and two tabs: 'Settings' and 'Status'. The 'Settings' tab is selected. Below the tabs, there is a form with the following elements: a dropdown menu labeled 'LLDP' with 'Enabled' selected, a text input field labeled 'Transmit Interval' with the value '30', and a range indicator '5 - 32768 sec.'. A green 'APPLY' button is located at the bottom of the form.

UI Setting	Description	Valid Range	Default Value
LLDP	Enable or disable Link Layer Discovery Protocol (LLDP).	Enabled / Disabled	Enabled
Transmit Interval	Specify the interval in seconds at which LLDP messages are sent.	5 to 32768	30

UI Setting	Description	Valid Range	Default Value
LLDP Ring Port Bypass	Enable or disable LLDP Ring Port Bypass	Enabled / Disabled	Disabled

LLDP Status List

Port	Nbr. ID	Nbr. Port	Nbr. Port Description	Nbr. System
3	00:90:48:00:00:04	1	100TX	NAT Router
8	88:3a:30:31:0e:03	162	4/3	TW447P2-Gig-SW14A-01

UI Setting	Description
Port	Shows the number of the port that connects to the neighbor device.
Nbr. ID	Shows the unique ID (typically the MAC address) that identifies the neighbor device.
Nbr. Port	Shows the port number of the connected neighbor device's interface that is used to connect to this device.
Nbr. Port Description	Shows the port description of the connected neighbor device's interface that is used to connect to this device.
Nbr. System	Shows the hostname of the neighbor device.

ARP Table

Menu Path: Diagnostics > Network Status > ARP Table

This page lets you see the device's Address Resolution Protocol (ARP) table.

Limitations

The ARP table can show up to 1024 entries.

The screenshot shows the ARP Table interface. It features a search bar at the top right and a table with the following columns: Index, MAC Address, IP Address, and Interface. The table contains three entries:

Index	MAC Address	IP Address	Interface
1	d0:67:26:a5:a3:f8	10.123.44.2	WAN
2	00:00:02:00:00:00	10.123.44.1	WAN
3	38:10:f0:d2:37:a0	10.123.44.3	WAN

At the bottom of the table, there is a pagination control showing "Max: 1024", "Items per page: 50", and "1 - 3 of 3".

UI Setting

Description

Index	Shows the index of the device entry.
MAC Address	Shows the MAC address of the device.
IP Address	Shows the IP address used for the device.
Interface	Shows the interface the device is connecting through.

Event Logs and Notifications

Menu Path: Diagnostics > Event Logs and Notifications

This section lets you set up and view your device's event logs and notifications.

This section includes these pages:

- Event Log
- Event Notifications
- Syslog
- SNMP Trap/Inform
- Email Settings
- SMS Settings

Event Log

Menu Path: Diagnostics > Event Logs and Notifications > Event Log

This page lets you browse and export your device's various event logs.

This page includes these tabs:

- System Log
- Firewall Log
- VPN Log
- Settings and Backup

Note

The timestamp on event logs will automatically synchronize with the NTP/SNTP server and applies to all new event logs. Refer to [System > Time > NTP/SNTP Server](#) for more details.

System Log

Menu Path: Diagnostics > Event Logs and Notifications > Event Log - System Log

This page lets you view your device's system-related event logs.

Limitations

The system log can record up to 1000 events.

Actions

- Click the **Refresh icon** () to refresh the logs.
- Click the **Clear System Log icon** () to delete all logs.
- Click the **Export icon** () to export all logs to a file.

The screenshot shows the 'Event Log' interface with tabs for System Log, Firewall Log, VPN Log, and Settings and Backup. The System Log tab is active. Below the tabs are icons for refresh, clear, and export, and a search bar. The main area contains a table with the following data:

Index	Timestamp	Severity	Additional message
1	2023/8/11 18:40:4+8:00	Informational	Auth Ok, Login Success via Ui: Web, Account=admin, Bootup=71, Startup=2d3941m38s
2	2023/8/11 18:50:7+8:00	Informational	Logout via Ui: Web, Account=admin, Bootup=71, Startup=2d3h27m42s
3	2023/8/11 17:43:57+8:00	Informational	Auth Ok, Login Success via Ui: Web, Account=admin, Bootup=71, Startup=2d2h45m32s
4	2023/8/11 10:52:15+8:00	Informational	Logout via Ui: Serial Console, Account=admin, Bootup=71, Startup=1d19h53m50s
5	2023/8/11 10:45:13+8:00	Informational	Auth Ok, Login Success via Ui: Serial Console, Account=admin, Bootup=71, Startup=1d19h46m48s
6	2023/8/10 17:14:25+8:00	Informational	Logout via Ui: Web, Account=admin, Bootup=71, Startup=1d2h15m59s
7	2023/8/10 17:5:43+8:00	Informational	Auth Ok, Login Success via Ui: Web, Account=admin, Bootup=71, Startup=1d2h7m18s

UI Setting

Description

Index

Shows the index of the event.

Timestamp

Shows the time of the event, including the date, time, and UTC time zone adjustment.

Severity

Shows the severity categorization of the event.

Additional message

Shows additional information about the event, based on the type of event. The username of the account will also be recorded for the following events: **Login Success, Login Fail, Configuration Change, User Logout.**

Firewall Log

Menu Path: Diagnostics > Event Logs and Notifications > Event Log - Firewall Log

This page lets you view your device's firewall-related event logs.

Limitations

Each firewall log can record up to 1000 events.

You can switch between different firewall logs by clicking on the drop-down menu.

- Trusted Access
- Malformed Packets
- DoS Policy
- Layer 3-7 Policy
- Protocol Filter Policy
- ADP
- IPS
- Session Control
- Layer 2 Policy

Actions

- Click the **Refresh icon** () to refresh the logs.
- Click the **Clear System Log icon** () to delete all logs.
- Click the **Export icon** () to export all logs to a file.

Trusted Access

Index	Timestamp	Severity	Ether Type	IP Protocol	Incoming Interface	Source MAC	Source IP	Source Port	Outgoing Interface	Destination IP	Destination Port	TCP Flags	ICMP Type	ICMP Code	Action	Additional message

UI Setting	Description
Index	Shows the index of the event.
Timestamp	Shows the time of the event, including the date, time, and UTC time zone adjustment.
Severity	Shows the severity categorization of the event.
Ether Type	Shows the EtherType that applies to this event.
IP Protocol	Shows the IP protocol for this traffic.
Incoming Interface	Shows the incoming interface for this traffic.
Source MAC	Shows the source MAC address for this traffic.
Source IP	Shows the source IP address for this traffic.
Source Port	Shows the source port for this traffic.
Outgoing Interface	Shows the destination interface for this traffic.
Destination IP	Shows the destination IP address for this traffic.
Destination Port	Shows the destination port for this traffic.
TCP Flags	Shows the TCP flags that apply to this event.
ICMP Type	Shows the ICMP type that applies to this event.
ICMP Code	Shows the ICMP code that applies to this event.
Action	Shows the action taken by the firewall for this event.
Additional message	Shows additional information about the event, based on the type of event.

DoS Policy

The screenshot shows a web interface for configuring DoS Policy. At the top, there is a search bar and a 'DoS Policy' dropdown menu. Below this is a table with the following columns: Index, Timestamp, Severity, Ether Type, Subcategory, IP Protocol, Incoming Interface, Source MAC, Source IP, Source Port, Outgoing Interface, Destination IP, Destination Port, TCP Flags, ICMP Type, ICMP Code, Action, and Additional message. The table is currently empty, and the footer indicates 'Max: 1000' items per page and '0 of 0' items displayed.

UI Setting	Description
Index	Shows the index of the event.
Timestamp	Shows the time of the event, including the date, time, and UTC time zone adjustment.
Severity	Shows the severity categorization of the event.
Ether Type	Shows the EtherType that applies to this event.
Subcategory	Shows the subcategory that applies to this event.
IP Protocol	Shows the IP protocol for this traffic.
Incoming Interface	Shows the incoming interface for this traffic.
Source MAC	Shows the source MAC address for this traffic.
Source IP	Shows the source IP address for this traffic.
Source Port	Shows the source port for this traffic.
Outgoing Interface	Shows the destination interface for this traffic.
Destination IP	Shows the destination IP address for this traffic.
Destination Port	Shows the destination port for this traffic.
TCP Flags	Shows the TCP flags that apply to this event.
ICMP Type	Shows the ICMP type that applies to this event.
ICMP Code	Shows the ICMP code that applies to this event.
Action	Shows the action taken by the firewall for this event.
Additional message	Shows additional information about the event, based on the type of event.

Layer 3-7 Policy

Index	Timestamp	Severity	Policy ID	Policy Name	Ether Type	IP Protocol	Incoming Interface	Source MAC	Source IP	Source Port	Outgoing Interface	Destination IP	Destination Port	TCP Flags	ICMP Type	ICMP Code	Action
-------	-----------	----------	-----------	-------------	------------	-------------	--------------------	------------	-----------	-------------	--------------------	----------------	------------------	-----------	-----------	-----------	--------

UI Setting	Description
Index	Shows the index of the event.
Timestamp	Shows the time of the event, including the date, time, and UTC time zone adjustment.
Severity	Shows the severity categorization of the event.
Policy ID	Shows the ID of the firewall policy that applies to this event.
Policy Name	Shows the name of the firewall policy that applies to this event.
Ether Type	Shows the EtherType that applies to this event.
IP Protocol	Shows the IP protocol for this traffic.
Incoming Interface	Shows the incoming interface for this traffic.
Source MAC	Shows the source MAC address for this traffic.
Source IP	Shows the source IP address for this traffic.
Source Port	Shows the source port for this traffic.
Outgoing Interface	Shows the destination interface for this traffic.
Destination IP	Shows the destination IP address for this traffic.
Destination Port	Shows the destination port for this traffic.
TCP Flags	Shows the TCP flags that apply to this event.
ICMP Type	Shows the ICMP type that applies to this event.
ICMP Code	Shows the ICMP code that applies to this event.
Action	Shows the action taken by the firewall for this event.

Protocol Filter Policy

Index	Timestamp	Severity	Application Protocol	Policy ID	Policy Name	Ether Type	IP Protocol	Incoming Interface	Source IP	Source Port	Outgoing Interface	Destination IP	Destination Port	Action
-------	-----------	----------	----------------------	-----------	-------------	------------	-------------	--------------------	-----------	-------------	--------------------	----------------	------------------	--------

UI Setting	Description
Index	Shows the index of the event.
Timestamp	Shows the time of the event, including the date, time, and UTC time zone adjustment.
Severity	Shows the severity categorization of the event.
Application Protocol	Shows which application this event is related to.
Policy ID	Shows the ID of the firewall policy that applies to this event.
Policy Name	Shows the name of the firewall policy that applies to this event.
Ether Type	Shows the EtherTypes for this traffic.
IP Protocol	Shows the IP protocol for this traffic.
Incoming Interface	Shows the incoming interface for this traffic.
Source MAC	Shows the source MAC address for this traffic.
Source IP	Shows the source IP address for this traffic.
Source Port	Shows the source port for this traffic.
Outgoing Interface	Shows the destination interface for this traffic.
Destination IP	Shows the destination IP address for this traffic.
Destination Port	Shows the destination port for this traffic.
TCP Flags	Shows the TCP flags for this traffic.
ICMP Type	Shows the ICMP type that applies to this event.
ICMP Code	Shows the ICMP code that applies to this event.
Action	Shows the action taken by the firewall for this event.

ADP

VPN Log

Menu Path: Diagnostics > Event Logs and Notifications > Event Log - VPN Log

This page lets you view your device's VPN-related event logs.

Limitations

The VPN log can record up to 1000 events.

Actions

- Click the **Refresh icon** () to refresh the logs.
- Click the **Clear System Log icon** () to delete all logs.
- Click the **Export icon** () to export all logs to a file.

  			 Search
Index	Timestamp	Severity	Additional message
1	2020/2/3 18:42:41+8:00	Notice	[vpn1] Initiating VPN connection
2	2020/2/3 18:42:41+8:00	Notice	[vpn1] VPN remote gateway unreachable
3	2020/2/3 18:39:56+8:00	Notice	[vpn1] Initiating VPN connection

UI Setting	Description
Index	Shows the index of the event.

Syslog

Menu Path: [Diagnostics](#) > [Event Logs and Notifications](#) > [Syslog](#)

This page lets you configure your device to connect to syslog servers to store event logs. When an event occurs, an event notification can be sent as a syslog UDP packet to the specified Syslog servers. Each syslog server can be enabled individually.

Administrators can manually import self-signed certificates for syslog client services. However, they should check the root certificate and validity of the signature before importing, according to the organization's security procedures and requirements. After importing a certificate, the administrator should check if the certificate has been revoked and if so, the certificate must be replaced. When the device sends an imported certificate to the syslog server, the syslog server will attempt to verify the certificate by searching the approved certificate pool on the server to identify the imported certificate.

Note

In order to ensure the security of your network, we recommend the following:

- The encryption algorithm of keys should be selected based on internationally recognized and proven security practices and recommendations.
- The lifetime of certificates generated for syslog client services should be short and in accordance with the organization's security procedures and requirements.
- For security reasons, it is recommended to send event logs to a centralized syslog server for continuous network event monitoring.

Limitations

You can connect to up to 3 syslog servers.

Syslog

<p>Syslog 1 Disabled ▾</p> <hr/> <p>Address 1</p> <hr/> <p>Syslog 2 Disabled ▾</p> <hr/> <p>Address 2</p> <hr/> <p>Syslog 3 Disabled ▾</p> <hr/> <p>Address 3</p> <hr/>	<p>Certificate 1 Disabled ▾</p> <hr/> <p>UDP Port 1 514</p> <hr/> <p>1 - 65535</p> <p>Certificate 2 Disabled ▾</p> <hr/> <p>UDP Port 2 514</p> <hr/> <p>1 - 65535</p> <p>Certificate 3 Disabled ▾</p> <hr/> <p>UDP Port 3 514</p> <hr/> <p>1 - 65535</p>

Delete SNMP Trap Account

Menu Path: Diagnostics > Event Logs and Notifications > SNMP Trap/Inform - SNMP Account

You can delete an account by using the checkboxes to select the entries you want to delete, then clicking the **Delete** () icon.

<input checked="" type="checkbox"/>	Name	Authentication Type	Encryption Method
<input checked="" type="checkbox"/> 	test	None	Disabled

Max. 1 Items per page: 50 1 - 1 of 1 |< < > >|

Email Settings

Menu Path: Diagnostics > Event Logs and Notifications > Email Settings

This page lets you configure your device's email notification settings. You can specify which mail server and account to use, and which email addresses to send email notifications to. Click **APPLY** to save your changes, or click **SEND TEST MAIL** to send a test email using the current settings and recipients.

Auto warning email messages will be sent through an authentication-protected SMTP server that supports CRAM-MD5, LOGIN, and PAIN methods of SASL (Simple Authentication and Security Layer) authentication.

We strongly recommend not entering your Account Name and Account Password if auto warning e-mail messages can be delivered without using an authentication mechanism.

Tools

Menu Path: [Diagnostics > Tools](#)

This section lets you use various tools to check for network issues.

This section includes these pages:

- [Port Mirroring](#)
- [Ping](#)

Port Mirroring

Menu Path: [Diagnostics > Tools > Port Mirroring](#)

This page lets you configure the port mirror function, which can be used to monitor data being transmitted through a specific port. This is done by setting up another port (the mirror port) to receive the same data being transmitted from, or both to and from, the port under observation.

Using a mirror port allows the network administrator to sniff the observed port to keep tabs on network activity.

Note

For security reasons, it is recommended to use port mirroring to send traffic to an intrusion detection system (IDS) for analysis.

Port Mirroring

Port Mirroring Configuration

Industrial Application

Menu Path: Industrial Application

This menu settings area lets you configure settings related to specific industrial applications.

This settings area includes these sections:

- IEC 61375

Note

Availability of this feature may vary depending on your product model and version.

IEC 61375 Setting

Menu Path: Industrial Application > IEC 61375

This section lets you configure IEC 61375 settings related to Ethernet Train Backbone Nodes (ETBN).

The IEC 61375 section includes these pages:

- Ethernet Train Backbone
- Communication Profile
- Operational Status

⚠ Warning

Do not connect ETBNs through ETB ports before the ETBN has been configured.

If Turbo Ring V2 and ETBN are enabled at the same time, Turbo Ring V2 must be configured before ETBN for Turbo Ring V2 to work normally.

Ethernet Train Backbone

Menu Path: Industrial Application > IEC 61375 > Ethernet Train Backbone

This page lets you configure Ethernet Train Backbone settings for your device.

This page includes these tabs:

- [TTDP Settings](#)
- [Local ETBN Status](#)
- [ETB Status](#)
- [TCN Multicast Table](#)

TTDP Settings

Menu Path: Industrial Application > IEC 61375 > Ethernet Train Backbone - TTDP Settings

This page lets you set up Train Topology Discovery Protocol (TTDP) for your router. Click **APPLY** to save your changes.

⚠ Warning

Enabling TTDP will overwrite settings for Port Trunk, VLAN, Interface, QoS, VRRP, and Turbo Ring V2.

Note

We recommend setting ETB ports to MDI mode, and using crossover cables for the interconnection of ETBNs.

Ethernet Train Backbone

Local Consist

Local Consist

Consist UUID
0 ✕ ⓘ

8bit-4bit-4bit-4bit-12bit

ETBN(s) in Consist: 1 ECN(s) in Consist

User can manually assign or generate random Consist UUID

UI Setting	Description	Valid Range	Default Value
Consist UUID	Shows the UUID of the local consist. Consists with the same UUID will be considered to be the same consist. Therefore, the consist UUIDs for different consists should be unique. You can manually assign a consist UUID, or you can generate a random one by clicking on the X button to erase the existing UUID, then clicking the Refresh (C) icon to generate a random UUID.	Valid 8bit-4bit-4bit-4bit-12bit UUID	0

UI Setting	Description	Valid Range	Default Value
ETBN(s) in Consist	Specify the number of ETBNs in this consist.	1 to 32	1
ECN(s) in Consist	Specify the number of ECNs in this consist.	1 to 32	N/A

Local ETBN

Local ETBN i

Local ETBN Static ID 1	Direction 1 Trunk 1	ETB Port Speed Auto
ETB Port VLAN ID 1000	Direction 2 Trunk 2	Port MDI/MDIX Auto

1-4094, 492 is reserved

UI Setting	Description	Valid Range	Default Value
Local ETB Static ID	Specify the static ID of this ETBN within the consist.	Drop-down list of ETBN Static IDs (depends on the ETBN(s) in Consist setting in Industrial Application > IEC 61375 > Ethernet Train Backbone - TTDP Setting)	1
Direction 1	Specify the consist direction for Direction 1. The default setting is ports 1 and 2 will point towards direction 1, and ports 5 and 6 will point towards direction 2.	Trunk 1 / Trunk 2	Trunk 1
ETB Port Speed	Specify the ETB port speed to use. When set to Auto , the port will use its default speed. For example, a 1G port set to Auto will use 1G for its port speed.	Auto / 1G / 100M	Auto
ETB Port VLAN ID	Specify the VLAN ID for the ETB ports. We recommend using the same VLAN ID for all ETBNs on each train.	1-4094, 492 is reserved	1000

UI Setting	Description	Valid Range	Default Value
Direction 2	Specify the consist direction for Direction 2. The default setting is ports 1 and 2 will be point towards direction 1, and ports 5 and 6 will point to direction 2.	Trunk 1 / Trunk 2	Trunk 2
Port MDI/MDIX	Specify the ETB port interface type.	Auto / MDI / MDIX	Auto

Consist Network

Limitations

You can create up to 32 ECN entries, depending on what the **ECN(s) in Consist** setting is set to. Refer to [TTDP Settings](#) for more information.

Static ID	ECN to ETBN	ECN Port VLAN ID	Interface IP address	ECN Ports
1	1	1001	10.1.0.1	3,4,7,8

UI Setting	Description
Static ID	Shows the static ID of this ETBN within the consist.
ECN to ETBN	Shows which ETBN in the consist will be connected to by the ECN.
ECN Port VLAN ID	Shows the VLAN ID of the ECN Port.
Interface IP address	Shows the interface IP address for the ECN.
ECN Ports	Shows the ports which the selected ECN will connect to.

Add ECN

Menu Path: Industrial Application > IEC 61375 > Ethernet Train Backbone - TTDP Settings

Clicking the **Add (+)** icon on the **Industrial Application > IEC 61375 > Ethernet Train Backbone - TTDP Settings** page will open this dialog box. This dialog lets you create a new ECN entry. Click **CREATE** to save your changes and add the new entry.

UI Setting	Description	Valid Range	Default Value
ECN to ETBN	Specify which ETBN in the consist will be connected by the ECN.	Drop-down list of ETBN Static IDs (depends on the ETBN(s) in Consist setting in Industrial Application > IEC 61375 > Ethernet Train Backbone - TTDP Setting)	N/A
ECN port VLAN ID	Specify the VLAN ID of the ECN port. Specifying a VLAN ID is required if the selected ECN is connected to this ETBN.	Valid VLAN ID	N/A

UI Setting	Description	Valid Range	Default Value
ECN interface IP address	Set the interface IP address for the ECN.	Valid IP address	N/A
ECN Ports	Specify which ports the selected ECN will connect to. Specifying ports is required if the selected ECN is connected to this ETBN. Available ports will vary depending on the product model. The port used by the ETBN cannot be selected.	Drop-down list of ports	N/A

Edit ECN

Menu Path: Industrial Application > IEC 61375 > Ethernet Train Backbone - TTDP Settings

Clicking the **Edit (✎)** icon for an entry on the **Industrial Application > IEC 61375 > Ethernet Train Backbone - TTDP Settings** page will open this dialog box. This dialog lets you edit an existing ECN entry. Click **APPLY** to save your changes.

Edit ECN 1

ECN to ETBN

CANCEL APPLY

UI Setting	Description	Valid Range	Default Value
ECN to ETBN	Specify which ETBN in the consist will be connected by the ECN.	Drop-down list of ETBN Static IDs (depends on the ETBN(s) in Consist setting in Industrial Application > IEC 61375 > Ethernet Train Backbone - TTDP Setting)	N/A
ECN port VLAN ID	Specify the VLAN ID of the ECN port. Specifying a VLAN ID is required if the selected ECN is connected to this ETBN.	Valid VLAN ID	N/A
ECN interface IP address	Set the interface IP address for the ECN.	Valid IP address	N/A
ECN Ports	Specify which ports the selected ECN will connect to. Specifying ports is required if the selected ECN is connected to this ETBN. Available ports will vary depending on the product model. The port used by the ETBN cannot be selected.	Drop-down list of ports	N/A

Delete ECN

Menu Path: Industrial Application > IEC 61375 > Ethernet Train Backbone - TTDP Settings

You can delete an ECN entry by using the checkboxes to select the entries you want to delete, then clicking the **Delete** (🗑️) icon.

The screenshot shows the 'Consist Network' interface. At the top left is a trash can icon for deleting entries. To the right is a search bar. Below is a table with columns: Static ID, ECN to ETBN, ECN Port VLAN ID, Interface IP address, and ECN Ports. A single row is visible with values: 1, 1, 1, 1.1.1.1, and 1. A checkbox is checked in the first column of this row. At the bottom left, it says 'Max. 3'. At the bottom right, it says 'Items per page: 5' and '1 - 1 of 1' with navigation arrows.

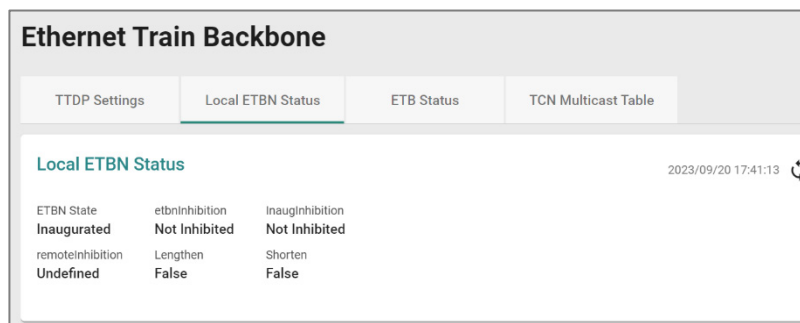

Static ID	ECN to ETBN	ECN Port VLAN ID	Interface IP address	ECN Ports
<input checked="" type="checkbox"/> 1	1	1	1.1.1.1	1

Local ETBN Status

Menu Path: Industrial Application > IEC 61375 > Ethernet Train Backbone - Local ETBN Status

This page lets you see the status of your local ETBN.

Local ETBN Status

UI Setting	Description
ETBN State	Shows the inauguration status of the ETBN state machine.
etbnInhibition	Shows information about any inhibition requests from this node.
inaugInhibition	Shows flags that are the result of the etbnInhibition field of topology frames received from all other ETBNs and the CN local value. During power-up, inaugInhibition is meaningless until the ETBN reaches the INAUGURATED state at least once. The value at startup is set to False to allow for the first inauguration.
remoteInhibition	This shows whether the remote composition is allowed to inaugurate (only set by end nodes) when lengthening takes place. The initial value should be set as UNDEFINED , which means it shall not be taken into account.
Lengthen	Shows the lengthen status due to a lengthening by an inaugurated composition (can be set by any node), such as the appearance of a new consist. Set to TRUE if a node detects a new node with a consist UUID different from those contained in the Train Network Directory.

UI Setting	Description
Shorten	<p>Shows the shorten status due to a shortening, which is the loss of at least one consist at the end of a train (can be set by any node).</p> <p>Set to TRUE if a node detects at least one consist is lost at the end of the train according to the Train Network Directory.</p> <p>It resets to FALSE ("stable") by default if the consist appears again or the Train Network Directory is updated.</p>

ETBN Line Status

ETBN Line Status				
Search				
Line	Line Status (DIR 1)	Line Status (DIR 2)	Hello Frame (DIR 1)	Hello Frame (DIR 2)
A	Off	On	-	Valid
B	Off	On	-	Valid

Items per page: 5 1 - 2 of 2

UI Setting	Description
Line	Shows which ETBN line (A or B) the entry is for.
Line Status (DIR 1)	Shows the link status of the line for Direction 1 of the ETBN line.
Line Status (DIR 2)	Shows the link status of the line for Direction 2 of the ETBN line.
Hello Frame (DIR 1)	Shows whether the neighbor Ethernet port in Direction 1 for the ETBN is up, and will send Hello Frames.
Hello Frame (DIR 2)	Shows whether the neighbor Ethernet port in Direction 2 for the ETBN is up, and will send Hello Frames.

Local ETBN Redundant Role

Local ETBN Redundant Role	
<input type="text" value="Search"/>	
CN ID	Local ETBN Redundant Role
1	Not Redundant

Items per page: 5 1 - 1 of 1 |< < > >|

UI Setting	Description
CN ID	Shows the ID of the consist node, which is statically defined.
Local ETBN Redundant Role	Shows which CN is connected to the Local ETBN and whether the CN has ETBN redundancy.

ETB Status

Menu Path: Industrial Application > IEC 61375 > Ethernet Train Backbone - ETB Status

This page lets you see the status of your ETB.

4	Inverse	00:90:E8:49:08:F2

Items per page: 5 1 - 4 of 4 < > >> <<

UI Setting	Description
ConnTableValid	Shows whether the Physical Topology is shared by all ETBNs (same connectivity table CRC is used for all ETBNs).
ConnTableCrc32	Shows the CRC32 value of the internal Connectivity Table.
Index	Shows the Index number of a node. The number of entries will vary between models and depending on how many ports have been set up.

UI Setting	Description
Orientation	Shows information about the orientation of the node with respect to the ETB reference direction.
MAC address	Shows the MAC address of the node.

Items per page: 5 1 - 4 of 4 < >

UI Setting	Description
EtbTopoCntValid	Shows whether the Logical Topology is shared by all ETBNs (same Train Network Directory CRC is used for all ETBNs).
etbTopoCnt	Shows the CRC32 checksum of the internal Train Network Directory.
Memorized etbTopoCnt	While the ETB node is in state INAUGURATED, etbTopoCnt field in TTDP TOPOLOGY frame is fixed to the memorized CRC of the Train Network Directory. The Memorized etbTopoCnt and etbTopoCnt may be different when "inaugInhibition" is inhibited
Index	Shows the Index number of a CN.
CstUUID	Shows the Consist Universal Unique ID (refer to IETF RFC 4122) of the CN.
CN Id	Shows the ID of the CN, which is statically defined.
Subnet Id	Shows the subnet ID of the CN on the ETB.
Train Subnet	Shows the Train Subnet IP of the CN.
ETBN Id	Shows the ID of the ETBN on the ETB.

UI Setting	Description
CstOrientation	Shows the orientation of the consist in relation to the direction of the train.

TCN Multicast Table

Menu Path: Industrial Application > IEC 61375 > Ethernet Train Backbone - TCN Multicast Table

This page lets you see the status of your TCN multicast entries.

Index	TCN Group Address	Inbound Interface	Outbound Interface(s)
1	239.192.0.0	ETB	ECN1
2	239.192.0.0	ECN1	ETB
3	239.192.0.1	ETB	ECN1
4	239.192.0.1	ECN1	ETB
5	239.192.0.2	ECN1	ETB

UI Setting	Description
Index	Shows the index of the TCN entry.
TCN Group Address	Shows the group address for the TCN.
Inbound Interface	Shows the ETBN inbound interface of the TCN.
Outbound Interface(s)	Shows the ETBN outbound interface of the TCN.

Communication Profile

Menu Path: Industrial Application > IEC 61375 > Communication Profile

This section lets you set up communication profiles for your device.

This section includes these pages:

- ECSP Settings
- SDTV2 Settings
- ECSP Status
- SDTV2 Status

ECSP Settings

Menu Path: Industrial Application > IEC 61375 > Communication Profile > ECSP Settings

This page lets you back up or restore the local consist info file and the TRDP configuration file.

Local Consist Info

Click **BACKUP** to back up the current local consist info file to your local host. To restore, select a local consist info file from your local host, then click **RESTORE**.

Note

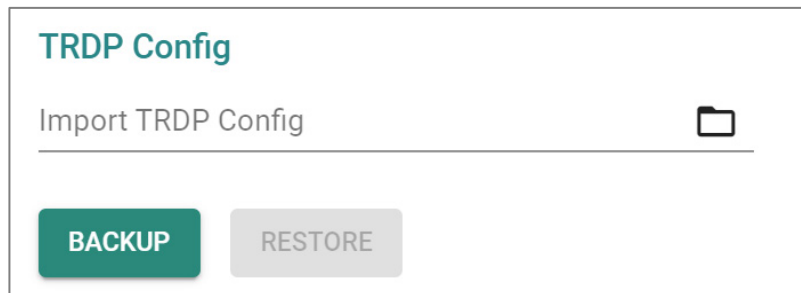

You cannot back up the local consist info file if one hasn't been previously loaded onto your router.

UI Setting	Description	Valid Range	Default Value
Import Local Consist Info	Select a local consist info file to restore from by clicking on the Folder (📁) icon , selecting the file to restore from, then clicking RESTORE . Refer to Structure and Syntax of Consist Info Configuration Files for more information.	Local file	N/A

TRDP Config

Click **BACKUP** to back up the current TRDP configuration to your local host. To restore, select a TRDP configuration file from your local host, then click **RESTORE**.

UI Setting	Description	Valid Range	Default Value
Import TRDP Config	Select a local TRDP configuration file to restore from by clicking on the Folder (📁) icon , selecting the file to restore from, then clicking RESTORE .	Local file	N/A

SDTv2 Settings

Menu Path: Industrial Application > IEC 61375 > Communication Profile - SDTV2 Settings

This page lets you enable or disable Safe Data Transmission protocol (SDTv2) telegrams.

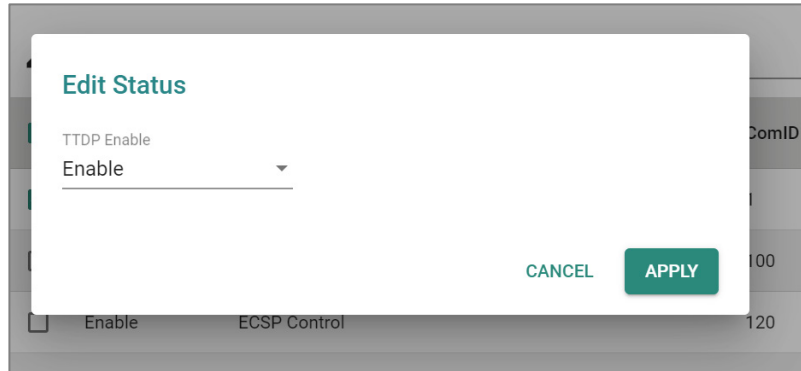

Communication profile				
ECSP Settings		SDTv2 Settings	ECSP Status	SDTv2 Status
Q Search				
<input type="checkbox"/>	Status	Telegram	ComID	
<input type="checkbox"/>	Enable	ETBCTRL	1	
<input type="checkbox"/>	Enable	TTDB Status	100	
<input type="checkbox"/>	Enable	ECSP Control	120	
<input type="checkbox"/>	Enable	ECSP Status	121	
Items per page: 5 1 - 4 of 4 < > >> <<				

UI Setting	Description
Status	Shows whether the telegram is enabled.
Telegram	Shows the name of the telegram.
ComID	Shows the ComID of the telegram.

Edit Status

Menu Path: Industrial Application > IEC 61375 > Communication Profile - SDTV2 Settings

Clicking the **Edit (✎)** icon after selecting entries on the **Industrial Application > IEC 61375 > Communication Profile - SDTV2 Settings** page will open this dialog box. This dialog lets you enable or disable the selected entries. Click **APPLY** to save your changes.

UI Setting	Description	Valid Range	Default Value
TTDP Enable	Enable or disable the selected telegrams.	Enable / Disable	Enable

ECSP Status

Menu Path: Industrial Application > IEC 61375 > Communication Profile - ECSP Status

This page lets you see the current status of the ECSP and the state machines.

ECSP Status

UI Setting	Description
ETB Control Service	Shows whether the ETB Control Service Provider (ECSP) is providing ETB Control Service or not, which may be impacted by the VRRP role. Active: Local ECSP (ETBN) is VRRP master, and has found an ECSC Local ECSP (ETBN) has no redundancy Not Active: Local ECSP (ETBN) is the VRRP backup
ECSC Status	Shows whether an ETB Control Service Client (ECSC) is communicating with the ECSP. Online: The ECSP received a ECSP Control Telegram from an ECSC and is currently connected. Offline: An ECSC previously connected to the ECSP, but is not currently connected. NotExist: The ECSP has not connected to an ECSC yet.

State Machine List

The State Machine List includes the 5 state machines that have been defined in IEC 61375-2-3.

Q Search	
State Machine	State
Leading	WaitForLeadReq
Confirmation/Correction	CompUnknown
ETB Control	EtbCtrlSetUp
Train Directory	TrnDirSetup
Operational Train Directory	Shared

Items per page: 5 1 - 5 of 5 |< < > >|

UI Settings	Description
State Machines	Shows the name of the state machine.

UI Settings	Description
State	Shows the current state of the state machine.
	Leading Init / WaitForLeadReq / WaitForAccept / WaitForLead / WaitForLed / IsLeading / IsLed
	Confirmation / Correction Init / CompClear / CompUnknown / CompSet / CompStored / CompReset
	ETB Control Init / WaitForEtbCtrl / EtbCtrlSetUp
	Train Directory Init / WaitForEtbInaug / WaitForCstInfo / TrnDirSetup
	Operational Train Directory Init / Invalid / Valid / Shared

SDTV2 Status

Menu Path: Industrial Application > IEC 61375 > Communication Profile - SDTV2 Status

This page lets you see the SDSRC and SDSINK information for SDTV2 telegrams.

ECSP SDSRC

This table shows the Safe Data Source (SDSRC) used for sending vital data packets (VDPs) in SDTV2 telegrams to a Safe Data Sink (SDSINK).

The screenshot shows a web interface titled "ECSP SDSRC" with a timestamp of "2023/09/20 17:58:46" and a refresh icon. Below the title is a search bar labeled "Search". The main content is a table with three columns: "Telegram", "ComID", and "Source Identifier (SID)". The table contains three rows of data:

Telegram	ComID	Source Identifier (SID)
ETBCTRL	1	0x9d9e7b4f
TTDB Status	100	0xb163bea5
ECSP Status	121	0x43206c09

At the bottom of the table, there is a pagination control showing "Items per page: 5" and "1 - 3 of 3" with navigation arrows.

UI Setting	Description
Telegram	Shows the name of the telegram.

UI Setting	Description
ComID	Shows the ComID for the telegram.
Source Identifier (SID)	Shows the SID for the telegram, which is an unsigned32 value computed as an SC-32 signature of the data structure.

ECSP SDSINK

This table shows the Safe Data Sink (SDSINK) used to receive vital data packets (VDPs) in SDTv2 telegrams from a Safe Data Source (SDSRC).

ECSP SDSINK

Search

Telegram	ComID	State	Expected Source Identifier (SID)
--	--	--	--

Items per page: 5 1 - 1 of 1

UI Setting	Description
Telegram	Shows the name of the telegram.
ComID	Shows the ComID for the telegram.
State	Shows the state of the telegram. RegularCommunication: In this state, transmitted VDPs cannot be considered to be safe. State SafeCommunication: In this state, transmitted VDPs can be considered to be safe.
Expected Source Identifier (SID)	Shows the SID of the expected SDSRC to receive VDPs from. This information is retrieved from the Train Topology Database (TTDB).

Operational Status

Menu Path: Industrial Application > IEC 61375 > Operational Status

This page lets you know the Status of your IEC 61375 related operational settings.

This page includes these tabs:

- Consist Info
- Train Directory
- Operational Train Directory
- TCN-URI Table

Consist Info

Menu Path: Industrial Application > IEC 61375 > Operational Status - Consist Info

This page lets you see information about the current consist.

Consist Info

The screenshot shows a web interface titled "Operational Status" with four tabs: "Consist Info", "Train Directory", "Operational Train Directory", and "TCN-URI Table". The "Consist Info" tab is active. It displays the following information:

Consist Class	Consist Type
consist	test
Consist ID	Consist Owner
consist2	TCMS
Consist UUID	
00000000-0000-0000-0000-000000000002	

At the top right of the "Consist Info" section, there is a timestamp "2023/09/20 18:01:34" and a refresh icon.

UI Setting	Description
Consist Class	Shows the CSTINFO class of the consist.
Consist Type	Shows the type of the consist.
Consist ID	Shows the ID of the consist.
Consist Owner	Shows the owner of the consist.
Consist UUID	Shows the UUID of the consist.

ETB List

ETB ID	Consist Network Count
0	1

UI Setting	Description
ETB ID	Shows the ID of the ETB. 0: ETB0 (operational network) 1: ETB1 (multimedia network) 2: ETB2 (other network) 3: ETB3 (other network)
Consist Network Count	Shows how many CNs are in the consists connected to the ETB.

Vehicle List

Vehicle List

Search

Vehicle ID	Vehicle Type	Vehicle Orientation	Consist Vehicle Number	Traction
veh2	intercity_train	same	1	true

Items per page: 5 1 - 1 of 1 |< < > >|

UI Setting	Description
Vehicle ID	Shows the ID of the vehicle.
Vehicle type	Shows the type of the vehicle.
Vehicle Orientation	Shows the orientation of the vehicle. same: Indicates that vehicle has the same direction with respect to the consist direction. inverse: Indicates that the vehicle is in the opposite direction with respect to the consist direction.
Consist Vehicle Number	Shows the index of the vehicle within the consist.
Traction	Shows whether the vehicle has traction.

Function List

Function List

Search

Name	Function ID	Group	Consist Vehicle Number	ETB ID	Consist Network ID

UI Setting	Description
Index	Shows the index number of the TCN-URI.
TCN-URI	Shows the Train Communication Network Uniform Resource Identifier (TCN-URI) of a component on the train.
Train Network IP	Shows the train network IP used for the TCN-URI.
Local IP	Shows the local IP used for the TCN-URI.

Chapter 4

Other Features

Other Features

This section covers other features of your device that may not have a related user interface.

The features in this section include:

- Firmware Image Recovery
- Soft Lockdown

Firmware Image Recovery Overview

Firmware Image Recovery refers to the use of multiple copies of firmware within a device to increase reliability and reduce the risk of system failure due to firmware corruption or errors.

In many electronic devices, firmware is stored in non-volatile memory such as flash memory, and any corruption or errors in the firmware can result in the device malfunctioning or becoming unusable. To mitigate this risk, firmware recovery involves storing multiple copies of the firmware within the device, and using a mechanism to switch to a backup copy of the firmware in case the primary copy becomes corrupted or fails.

Overall, Firmware Image Recovery is a useful technique for increasing the reliability and availability of electronic devices, particularly those used in critical applications where system failure can have serious consequences.

Methodology

This device supports a “Dual-image” firmware mechanism to minimize the possibility of system failure, such as in the following situations:

1. When the user encounters an accident when upgrading the device firmware, such as a power outage, which may cause firmware corruption.
2. When the memory encounters lifespan issues or damage from external factors, parts of partitions may become corrupted.

This mechanism involves storing two copies of the firmware in separate memory partitions within the device, and using a boot loader to select the active copy at runtime. If a situation occurs, the firmware can still roll back to the previous version to boot the device.

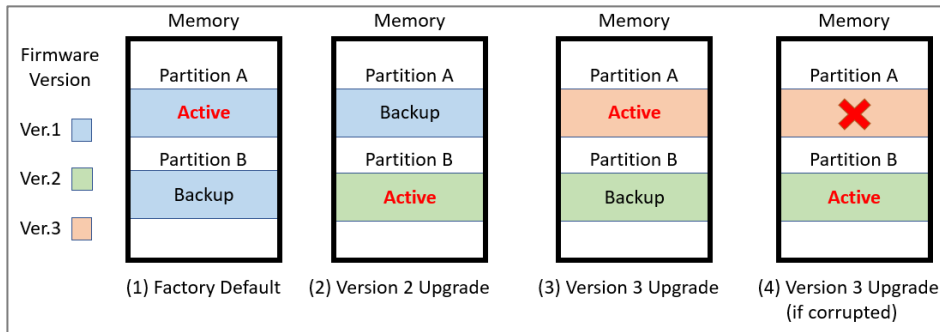

⚠ Warning

Firmware Image Recovery will not be able to help if the bootloader sector or the entire memory is corrupted.

How Dual-imaging Works

Here is an overview of how the Dual-image function works.

1. When the product leaves the factory, it will keep two identical copies of the firmware version 1 in separate memory partitions A and B within the device. Partition A will be selected as the active copy by default.
2. When the user upgrades the firmware version 2, Partition B will be overwritten to store the new image as well as be selected as the active copy at the same time. Partition A will keep a previous version 1 as a backup.
3. When the user upgrades the firmware version 3, Partition A will be overwritten to store the new image as well as be selected as the active copy at the same time. Partition B will keep a previous version 2 as a backup.
4. Based on (3), if the user encounters an accident when upgrading the firmware version 3 and Partition A is corrupted, the bootloader will choose backup Partition B as the active one to continue to boot the system and the system will record a "Boot Failed, Fallback to Previous Firmware" event into the system logs.

Note

Resetting the device to factory default settings only restores user configurations, and will not restore the firmware image in both partitions.

- This mechanism is done automatically by the system and is not user-configurable.

Soft Lockdown

Note

Soft Lockdown Mode is a feature designed for railway applications and is only supported by the TN-4900 Series.

Moxa routers can act as firewalls to help provide protection from external attacks that try to gain access and control over the network. On the other hand, while protecting the network, it is also important to prevent potential malfunctions that may occur and avoid unexpected network operation failures.

To handle this, Soft Lockdown Mode is a monitoring and protection mechanism that monitors important indicators and enters Soft Lockdown Mode once user-defined failure criteria are reached to ensure that device operation remains stable. For details about Soft Lockdown Mode settings, refer to [Firewall > Soft Lockdown Mode](#).

Soft Lockdown Criteria

The criteria for entering and leaving Soft Lockdown Mode are defined by the following:

- **Performance Thresholds:** If the CPU utilization % exceeds a user-defined threshold, or the amount of free memory % goes below a user-defined threshold, a failure will be detected for the current cycle.
- **Monitoring Interval:** This defines how long a single monitoring cycle will be.
- **Number of Cycles to Enter Soft Lockdown Mode:** This defines how many consecutive cycles with failures are required to enter Soft Lockdown Mode.
- **Number of Cycles to Leave Soft Lockdown Mode:** This defines how many consecutive cycles without failures are required to leave Soft Lockdown Mode.
- **Critical Services:** If any of the following critical services are enabled, the device continually check to see whether the services are alive. The device will enter Soft Lockdown Mode if any enabled critical service is no longer alive, and all enabled critical services must be alive to leave Soft Lockdown Mode.

The critical services that apply to Soft Lockdown Mode are as follows:

- DHCP Server (refer to [Network Service > DHCP Server](#))
- DHCP Relay Agent (refer to [Network Service > DHCP Server - DHCP Relay Agent](#))
- SNMP Server (refer to [SNMP](#))
- Turbo Ring V2 (refer to [Redundancy > Layer 2 Redundancy > Turbo Ring V2](#))

Warning

When the device is operating normally, its CPU and memory usage can vary due to various factors. Apart from potential attacks, the number of devices connected to the router and application settings can also lead to increased demands on CPU and memory.

It is important to carefully assess the usage and configuration of this feature to avoid triggering Soft Lockdown Mode due to normal usage to avoid impacting regular operations.

Entering Soft Lockdown Mode

The device will enter Soft Lockdown Mode when any of the following occur:

- The number of consecutive cycles with failures reaches the defined **Number of Cycles to Enter Soft Lockdown Mode**
- Any of the enabled **Critical Services** are no longer alive

When in Soft Lockdown Mode

In Soft Lockdown Mode, the device will do the following:

- Block all traffic (both ingress and egress) on the interfaces where firewall rules are applied
- Log the event and the reason for the event in the system log

Warning

When Soft Lockdown Mode is enabled, the port settings and VLAN settings should not be modified in order to prevent a mismatch for the Soft Lockdown Mode interface settings.

Leaving Soft Lockdown Mode

The device will leave Soft Lockdown Mode under any of the following conditions:

- The number of normal consecutive cycles without failures reaches the defined **Number of Cycles to Leave Soft Lockdown Mode** AND all enabled **Critical Services** are alive.
- The device is restarted. After restarting, the device will enter normal operation and will only enter Soft Lockdown Mode if the criteria are fulfilled.

When leaving Soft Lockdown Mode, the device will do the following:

- Resume all traffic (both ingress and egress) on the interfaces where firewall rules are applied
- Log the event in the system log

Chapter 5

Device Applications

Device Applications

This section goes over different device applications to help you better understand the applications themselves, and to show you how the device can help you implement those applications.

The following applications are covered:

- Network Segmentation
- Routing

Network Segmentation

About Network Segmentation

Network Segmentation creates isolated virtual networks.

Segmenting a network reduces congestion and improves network performance by removing unnecessary traffic in a particular segment. For instance, segregating the passenger Wi-Fi network from the TCMS network in a train communication system ensures that the TCMS devices are not impacted by guest traffic. Such an approach helps to mitigate congestion and enhance the overall efficiency of the network.

There are two types of network segments:

- Layer-2 segments use numbered, virtual LAN segments (VLANs) to create isolated networks.
- Layer-3 segments use unique IP prefixes to create subnets.

Layer-2 Segments

A layer-2 segment is essentially a single broadcast domain. All devices connected to the

segment will receive any broadcast traffic sent within it. Layer-2 segmentation uses numbered VLANs to create isolated logical segment, which allows for the separation of traffic between different VLANs.

Layer-3 Segments

In an IP network, a layer-3 segment is referred to as a subnetwork or subnet and includes all nodes that share the same network prefix as defined by their IP addresses and network mask. A router is needed to facilitate communication between layer-3 subnets. Hosts on the same subnet can communicate directly using the layer-2 segment that connects them.

VLANs in Depth

A VLAN, or Virtual Local Area Network, is a logical grouping of devices on a network.

This technology allows network administrators to divide a large network into smaller, more manageable segments without the need for additional physical hardware. Devices within a VLAN can be located anywhere on the network but communicate as though they are on the same physical segment. This facilitates traffic management, as administrators can ensure traffic is directed only to devices within the same VLAN by assigning a VLAN tag to each Ethernet frame. Consequently, VLANs provide a means to segment a network beyond the constraints of physical connections, a limitation inherent in traditional network design. VLANs can be utilized to segment your network into various groups, such as:

- **Departmental groups**—One VLAN for the R&D department, another for Office Automation, etc.
- **Hierarchical groups**—One VLAN for directors, another for managers, and another for general staff.
- **Usage groups**—One VLAN for email users and another for multimedia users.

VLAN Standards and Implementation

The functioning of VLANs is guided by IEEE 802.1Q, often referred to as Dot1q. This standard outlines the protocol for VLAN tagging on Ethernet frames within an IEEE 802.3 Ethernet network. During the transmission of data between switches, VLAN tags identify the VLAN ownership of frames. Networking equipment reads these tags and ensures that tagged frames are delivered to devices within that VLAN, maintaining the network's logical segmentation.

A VLAN tag is a specific piece of data embedded in the header of an Ethernet frame. It comprises a 4-byte field carrying key information, such as the VLAN ID (VID) and priority level. The VID is a numerical identifier that uniquely links the frame to a specific VLAN. The priority field within the tag plays a critical role in prioritizing certain types of traffic within a VLAN. This structure contributes to effective network traffic management by giving precedence to certain data when necessary.

Benefits of VLANs

The main benefit of VLANs is that they provide a network segmentation system that is far more flexible than traditional networks. Using VLANs also provides you with three other benefits:

VLANs help control traffic

With traditional networks, congestion can be caused by broadcast traffic that is directed to all network devices, regardless of whether or not they need it. VLANs increase the efficiency of your network because each VLAN can be set up to contain only those devices that need to communicate with each other.

VLANs simplify device relocation

In traditional networks, administrators spend significant time managing moves and changes, requiring manual updates of host addresses when users switch sub-networks.

In contrast, VLANs simplify this process. For example, when relocating a host from Port 1 to Port 6 in a different network section, simply assign Port 6 to the relevant VLAN (e.g., VLAN R&D A). This enables seamless communication between VLANs, eliminating the need for re-cabling.

VLANs provide extra security

Devices within each VLAN can only communicate with other devices on the same VLAN. If VLAN R&D B needs to communicate with VLAN OA(Office Automation) A, the traffic must pass through a routing device or Layer 3 switch.

Important: Network segmentation is not a substitute for network security. While network segmentation can provide a degree of isolation that contributes to the overall security environment, the primary benefit of VLANs is improved performance by ensuring minimal crosstalk between unrelated systems. Network segmentation should be complimented with network security procedures.

Scenario: Layer 2 Segmentation of 3 Factories

Short Description: A manufacturer uses layer 2 segmentation to manage traffic between three different factories, each with many devices.

Two switches are used to connect the all of the devices together on the same network, but devices from any factory may be connected to either switch. To simplify management and ensure smooth operations, we can configure the switches to make sure that each factory is on its own VLAN.

Each VLAN can be enlarged using simple switches to connect any number of devices in the factory

For our example scenario, we will simplify to two devices connected to each switch. Traffic VLANs are usually assigned to ports, so it's important to note which port we'll be using for each device. The switches are connected each other using port 8, and will allow

VLANs to be split between the two switches as necessary, without causing interference or performance drops on the others.

We need a topology that:

- Allows devices on the same VLAN to communicate with each other
- Ensure devices on different VLANs cannot communicate with each other

This diagram outlines how we might create a network meeting these requirements. Each factory is on its own VLAN, and that Factory 2's VLAN is split between two switches. With VLAN segmentation and a Trunk connecting the two switches, Factory 2's VLAN will have comparable performance to VLANs within the same switch. Because of VLAN isolation, administrators can manage and prioritize traffic to ensure that packets do not leave their corresponding VLAN.

Important: Be careful when configuring VLANs on a remote switch. Modifications to the configuration could affect connectivity. For example, if the management VLAN of the switch is VLAN 1 and you are connected to ports that do not belong to VLAN 1, you may be disconnected from the switch during configuration.

Example: Creating VLANs for Layer 2 Segmentation of 3 Factories

Create VLANs in preparation for assigning them to ports.

Before you begin: Make sure you have an environment configured in line with our scenario. This includes:

- 3 routers in a ring topology with backbone connected on ports 7 and 8
- 2 gateways for each router (Service A and Service B) , connected at ports 1 and 2, respectively
- Administrator credentials to all three routers

To create VLANs for this example, do the following:

1. Sign in to Switch A using administrator credentials.
2. Go to **Network Configuration**→**Layer 2 Switching**→**VLAN**.
3. To add a VLAN ID, click on the **Settings** tab, and then click the **Add (+)** button.
Result: The **Create VLAN** screen appears.
4. Specify the VLAN to create in the **VID**, and then click **Create**. For Factory 1, we will create VLAN 1.
Result: The VLAN will appear on the VLAN table at the top of the page.
5. Repeat this process to create VLANs 2 and 3 for the factories, and then create VLAN 1000 for the link between switches.

Results: We created VLANs for each factory (VIDs 1, 2, 3) and the VLAN for communication between switches (VID 1000).

What to do next: After you have created all 4 VLANs on Switch A, repeat this process on Switch B. Once Switch B is configured, you can continue on to assigning VLANs to ports.

Example: Assigning VLANs to Ports on Switch A

VLANs must be assigned to ports on Switch A to route traffic correctly.

Now that you've created the VLANs, they need to be assigned to ports so that traffic from those ports will be routed over the correct VLAN. A similar procedure must be performed on each switch or router on the network.

1. Sign in to Switch A using administrator credentials.
2. Go to **Network Configuration**→**Layer 2 Switching**→**VLAN**.
3. To assign the newly created VLAN ID to a port, find the port on the **Port Table** on

the lower part of the page, and then click the corresponding  **[Edit]** button.

Since we're assigning factory 1 to ports 1 and 2, start with **Port 1**. If you are repeating this step, you can substitute **Port 1** with information from the table at the end of this procedure.

Result: The **Edit Port Settings** panel appears.

Edit Port G8 Settings

Mode
Access

PVID
1

Tagged VLAN

Untagged VLAN
1

CANCEL APPLY

4. Specify the **Mode** and **PVID** that will be assigned to the port, and then click **Apply**. To assign the chosen port to Factory 1, specify **Mode Access** and **PVID** as 1.

Tutorial Info:

- **Access mode** is used when connecting single devices without tags. These are usually end-user devices that belong to a single VLAN, and do not need to communicate with devices in other VLANs.
- **Trunk mode** allows a port to carry traffic for multiple VLANs over a single physical connection. This is useful for linking switches together that may have many different VLANs.
- **Hybrid mode** is similar to a Trunk port, except users can explicitly assign tags to be removed from egress packets.
- **Note:** The port VID (PVID) setting will apply a VLAN tag only for untagged traffic coming through that port. If traffic going through the port has already been tagged with a VLAN ID, the PVID setting will not change the existing tag.

Result: The **Port Table** will show the new port configuration.

5. To add the remaining ports, repeat this procedure with the following substitutions and settings:

Port	Settings
2	PVID: 1 Mode: Access Mode
5	PVID: 2 Mode: Access Mode
8	PVID: 1000 Mode: Trunk Mode Tagged VLAN: 1, 2, 3

Results: Ports on Switch A have been assigned VIDs and modes, ensuring that untagged traffic on ports 1 and 2 will automatically be tagged as VLAN 1. Traffic on port 5 will be automatically tagged as VLAN 2. Port 8 has been configured as a Trunk that will allow traffic to move between switches while retaining the tags.

What to do next: Assign VLANs to Ports on Switch B.

Important: The Port settings on each switch will be slightly different. Make sure each switch is configured correctly by following the instructions for Switch B.

Example: Assigning VLANs to Ports on Switch B

VLANs must be assigned to ports on Switch B to route traffic correctly.

Now that you've created the VLANs, they need to be assigned to ports so that traffic from those ports will be routed over the correct VLAN. A similar procedure must be performed on each switch or router on the network.

1. Sign in to Switch A using administrator credentials.
2. Go to **Network Configuration**→**Layer 2 Switching**→**VLAN**.

3. To assign the newly created VLAN ID to a port, find the port on the **Port Table** on the lower part of the page, and then click the corresponding  **[Edit]** button.

Since we're assigning factory 2 to port 3, start with **Port 3**. If you are repeating this step, you can substitute **Port 3** with information from the table at the end of this procedure.

Result: The **Edit Port Settings** panel appears.

Edit Port G8 Settings

Mode
Access

PVID
1

Tagged VLAN

Untagged VLAN
1

CANCEL APPLY

4. Specify the **Mode** and **PVID** that will be assigned to the port, and then click **Apply**. To assign the chosen port to Factory 3, specify **Mode Access** and **PVID** as 2.

Tutorial Info:

- **Access mode** is used when connecting single devices without tags. These are usually end-user devices that belong to a single VLAN, and do not need to communicate with devices in other VLANs.
- **Trunk mode** allows a port to carry traffic for multiple VLANs over a single

physical connection. This is useful for linking switches together that may have many different VLANs.

- **Hybrid mode** is similar to a Trunk port, except users can explicitly assign tags to be removed from egress packets.
- **Note:** The port VID (PVID) setting will apply a VLAN tag only for untagged traffic coming through that port. If traffic going through the port has already been tagged with a VLAN ID, the PVID setting will not change the existing tag.

Result: The **Port Table** will show the new port configuration.

5. To add the remaining ports, repeat this procedure with the following substitutions and settings:

Port	Settings
6	PVID: 1 Mode: Access Mode
7	PVID: 2 Mode: Access Mode
8	PVID: 1000 Mode: Trunk Mode Tagged VLAN: 1, 2, 3

Results: Ports on Switch B have been assigned VIDs and modes, ensuring that untagged traffic on ports 6 and 7 will automatically be tagged as VLAN 3. Traffic on port 3 will be automatically tagged as VLAN 2. Port 8 has been configured as a Trunk that will allow traffic to move between switches while retaining the tags.

When combined with the previous settings, we complete the network segmentation. Traffic on VLANs 1-3 will remain isolated, and VLAN 1000 will allow traffic between switches while retaining VLAN tagging.

Scenario: Layer 3 Segmentation of Two Services

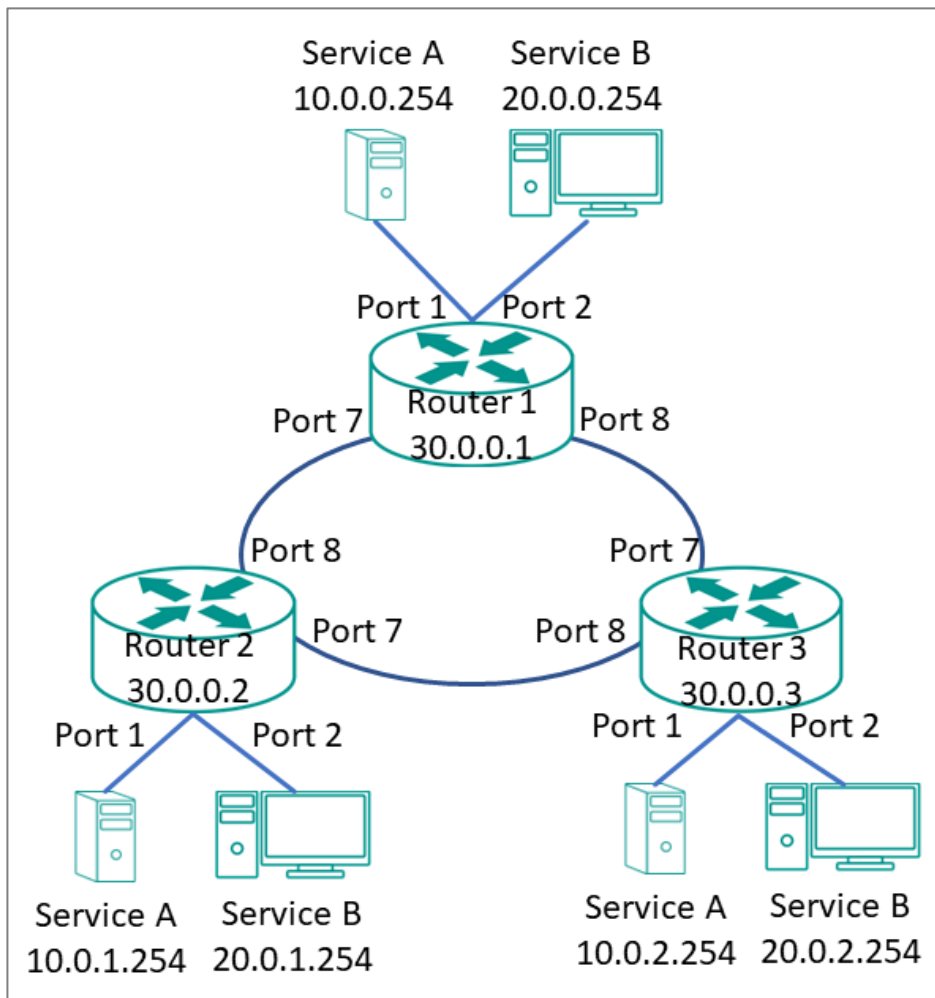

Short Description: A manufacturer uses layer 3 segmentation to manage traffic between three different factories, each with many devices.

Three routers are used to connect the all of the devices together on the same network, but devices from any factory may be connected to either switch. Each factory has devices running Service A and Service B. Devices need to connect to the corresponding service in other factories, while being isolated from the different services in their own factories.

Each VLAN can be enlarged using simple switches to connect any number of devices in the factory.

For our example scenario, we will simplify to two devices (one for each service) connected to each router. These devices will serve as gateways for additional devices connected to their corresponding service. We can assign separate subnets to each port (an interface), so it's important to note which port we'll be using for each device. We need a topology that:

- Allows devices on the same subnet to communicate with each other
- Ensure devices on different subnet cannot communicate with each other

This diagram outlines how we might create a network meeting these requirements. Each service is on its own subnet. Routers are connected in a ring topology, also on its own subnet. Because of subnet isolation, administrators can manage and prioritize traffic to ensure that packets do not leave their corresponding subnet.

To deploy this topology we need to do the following:

- Configure VLANs for each interface and bind them to ports
- Configure IP ranges for each interface and assign them to ports

In our example, we are segmenting by Service, rather than by area.

Example: Creating VLANs for Layer 3 Segmentation

Create VLANs in preparation for assigning them to ports.

Before you begin: Make sure you have an environment configured in line with our scenario. This includes:

- 3 routers in a ring topology with backbone connected on ports 7 and 8
- 2 gateways for each router (Service A and Service B) , connected at ports 1 and 2, respectively
- Administrator credentials to all three routers

To create VLANs for this example, do the following:

1. Sign in to Switch A using administrator credentials.
2. Go to **Network Configuration**→**Layer 2 Switching**→**VLAN**.
3. To add a VLAN ID, click on the **Settings** tab, and then click the  **[Add]** button.

Result: The **Create VLAN** screen appears.

4. Specify the VLAN to create in the **VID**, and then click **Create**. For Service A, we will create VLAN 10.

Result: The VLAN will appear on the VLAN table at the top of the page.

5. Repeat this process to create VLAN 20 for Service B, and then create VLAN 1000 for the link between switches.

Results: We created VLANs for each Service (VIDs 10 and 20) and the VLAN for backbone between different sites (VID 1000).

What to do next: After you have created all 3 VLANs on Router 1, repeat this process on Routers 2 and 3. The configuration options will be the same. Once VLANs have been configured on all routers, you can move on to assigning VLANs to ports.

Example: Assigning IPs to Router Interfaces

IP subnets must be assigned to interfaces to ensure traffic from corresponding VLANs is segmented correctly.

To assign IPs to router interfaces:

1. Sign in to Router 1 using administrator credentials.
2. Go to **Network Configuration**→**Network Interfaces**→**LAN**, and then press  **[Add]**.
Result: The **Create LAN Interface Entry** screen appears.
3. To add the interface for Service A, specify all of the following, and then click **Create**:

Field	Setting
Name	Service A
VLAN ID	10
IP Address	10.0.1.254
Netmask	8 (255.0.0.0)

4. **Result:** The LAN interface will appear on the Network Interface list.
5. To add the interface for Service B, specify all of the following, and then click **Create**:

Field	Setting
Name	Service B
VLAN ID	20
IP Address	20.0.1.254
Netmask	8 (255.0.0.0)

6. **Result:** The LAN interface will appear on the Network Interface list.
7. To add the interface for the backbone connection, specify all of the following, and then click **Create**:

Field	Setting
Name	Backbone
VLAN ID	1000
IP Address	30.0.0.1
Netmask	8 (255.0.0.0)

8. **Result:** The LAN interface will appear on the Network Interface list.

Results: Interfaces have been configured on Router 1 to allow effective network segmentation. Now you need to configure the additional networks.

What to do next: Repeat this task with the following adjustments:

Router	Item	Value
Router 2	Service A	10.0.2.254
	Service B	20.0.2.254
	Backbone	30.0.0.2
Router 3	Service A	10.0.2.254
	Service B	20.0.2.254
	Backbone	30.0.0.2

Once all routers have been configured with the correct IP interfaces, you can configure a routing solution. Once that's done, your network will be ready to use.

Example: Configuring Static Routing for Layer 3 Segmentation

For complex environments, routing must be configured.

This example uses simple static routing to route traffic across the network. A production network may chose a dynamic routing option instead.

To configure dynamic routing for the Layer 3 example:

1. Sign in to Switch A using administrator credentials.
2. Go to **Routing**→**Unicast Route**→**Static Routes**, and then click  **[Add]**.
 - **Result:** The **Create new static route** panel appears.
3. Specify all of the following:

Item	Value
Name	Service A Router 2
Status	Enable
Destination Address	10.0.1.254 Refers to Production Service A on Router 2.
Subnet Mask	8 (255.0.0.0) Refers to the subnet mask of the destination address.
Next Hop	30.0.0.2 Refers to the Router 2 Interface as the next hop on the network.
Metric	1

4. Click **Create**.
 - **Result:** The new static routing entry should appear in the routing table.
5. Repeat this process for Service B. Specify all of the following:

Item	Value
Name	Service B Router 2
Status	Enable
Destination Address	20.0.1.254 Refers to Production Service A on Router 2.
Subnet Mask	8 (255.0.0.0) Refers to the subnet mask of the destination address.
Next Hop	30.0.0.2 Refers to the Router 2 Interface as the next hop on the network.
Metric	1

6. Once this step is complete, repeat the process on Routers 2 and 3. The information for each router should appear as follows:

Item	Service A Router 1	Service B Router 1	Service A Router 2	Service B Router 2	Service A Router 3	Service B Router 3
Appears On	Routers 2/3	Routers 2/3	Routers 1/3	Routers 1/3	Routers 1/2	Routers 1/2
Name	Service A Router 1	Service B Router 1	Service A Router 2	Service B Router 2	Service A Router 3	Service B Router 3
Status	Enable	Enable	Enable	Enable	Enable	Enable
Destination Address	10.0.0.254	20.0.0.254	10.0.0.254	20.0.1.254	10.0.0.254	20.0.2.254
Subnet Mask	8 (255.0.0.0)	8 (255.0.0.0)	8 (255.0.0.0)	8 (255.0.0.0)	8 (255.0.0.0)	8 (255.0.0.0)
Next Hop	30.0.0.1	30.0.0.1	30.0.0.2	30.0.0.2	30.0.0.3	30.0.0.3
Metric	1	1	1	1	1	1

Results: Once the routing configuration is completed, the Example Layer 3 Segmented Network will be ready to use. This will ensure that packets for each service will be isolated from the other, while still be efficiently guided around the network.

Routing

About Routing

IP routing is the process of forwarding Internet Protocol (IP) traffic between different networks using one or more intermediate devices.

When one device wants to send a packet to another on a different network, it forwards the packet to its default gateway—usually a router. The router examines the destination IP address and determines the next "hop" along the path to the destination. This process continues with subsequent routers until the packet reaches its destination. Each router along the path checks its own routing table to determine the best path for the packet. Routing tables contain information about network topology and a list of networks and associated routes. Each route correlates information by destination IP or IP range, and includes information such as the next-hop router and the cost of sending packets along that route.

Static routing and **dynamic routing** are two methods of populating the routing table with information about how to reach different networks.

Static routing is manually-configured. Network administrators configure the routing table on each router. This method is simple to configure and allows packets to take predictable paths as long as network topology does not change.

Dynamic routing protocols automatically update the routing table on each router. This method is more flexible and scalable, making it suitable for larger and more complex networks.

In addition to how routes are configured, packets can be routed between a single sender and single recipient (**unicast**), or from one sender to multiple devices at a time (**multicast**).

Unicast delivery is used to send packets from one sender to one recipient, as is typically the case with most network traffic. When a device sends a packet with an unicast destination address, the router looks up the destination address in its routing table and forwards the packet to the next hop on the path to the destination.

Multicast delivery, on the other hand, is used to send packets from one sender to many recipients. With multicast, a single packet is sent out to a group of devices on the network that have expressed interest in receiving packets for that group. This is useful for applications such as video streaming, where the same content needs to be sent to multiple devices simultaneously. Dynamic multicast routing protocols, such as Protocol Independent Multicast (**PIM**), are used to ensure that multicast packets are delivered only to devices that have expressed interest in receiving them.

Routing and Packet Delivery

	Unicast	Multicast
Static	Manual Configuration	Manual Configuration

	Unicast	Multicast
Dynamic	RIP OSPF	PIM

Note

The TN-4908 series currently only supports static multicast routes in multicast stream routing.

About Static Routing

A static route is a manually configured network path used to deliver network traffic to a specific destination network or host. Unlike dynamic routes established by routing protocols, static routes are created and managed by a network administrator. They are typically used in small networks or situations where there is a limited number of destinations that need to be reached.

Among these static routes, a special type known as the default route, or 'gateway of last resort', plays a critical role. This default route, often designated as 0.0.0.0/0, represents a catch-all path. When a device doesn't have a specific route for a packet's destination IP address, it will utilize the default route, sending the data along this path. This ensures that all data, regardless of its destination, has a route to follow.

While both default and static routes are manually configured, they serve different purposes. Static routes are used for specific, predefined network paths, while the default route is a catch-all, used when no other path is available for a specific data packet. This allows for increased control over network traffic while ensuring that data can reach otherwise unspecified networks, typically including the public Internet.

Static routes, including default routes, offer several advantages, including:

- More control over network traffic, allowing administrators to direct traffic along

specific paths.

- Less overhead and resource usage, as static routes don't require routers to exchange routing information.
- Faster convergence, since there are no routing updates to process.

However, static routes also have some disadvantages:

- May be time-consuming and prone to human error, as administrators must manually configure and update routes.
- Unable to adapt to network changes automatically, requiring manual intervention to update routing tables when network topology changes.
- May not scale well in large networks with numerous destinations and frequent changes.

In summary, static routing is a method for unicast communication in which network paths are manually configured by network administrators. While they offer more control over network traffic and can improve performance in some cases, static routes can be time-consuming to manage and may not be well-suited for large, dynamic networks.

About Multicast Routing

Multicast routing is an efficient method for transmitting network traffic to a group of devices simultaneously. This approach helps conserve network resources, improve performance, and reduce congestion by sending only one copy of a message to all interested devices in the group.

A **Static Multicast Route** is a manually configured network path used to deliver multicast traffic to a specific group of devices on a network. It is a type of multicast route that is manually created and configured by a network administrator, rather than dynamically established by a multicast routing protocol. Static multicast routes are typically used in small networks where the multicast group membership is known and does not change frequently. They can also be used in situations where the multicast

traffic needs to be routed through a specific path in the network, or when multicast traffic needs to be constrained to a specific set of network interfaces.

Note

While enabling the static multicast routing, it is crucial to regularly review and adjust your configurations in response to any alterations in the network topology or multicast group memberships.

About Selecting a Routing Protocol

Short Description: There are several factors to consider when selecting a routing protocol.

1. **Network Size:** In a small network with only a few L3 devices with two or three interfaces, static routing is often the simplest and most efficient option. Dynamic routing, on the other hand, is more suitable for multiple Layer 3 interfaces with many devices and complex interconnections.
2. **Topology Stability:** If the network topology is relatively stable and changes infrequently, static routing can be a reliable and predictable choice. In contrast, dynamic routing protocols like **RIP** and **OSPF** are designed to adapt to changes in the network, making them better suited for networks that are constantly changing.
3. **Operational Cost:** Static routing requires manual configuration of each router, which can be time-consuming and error-prone in large networks. Dynamic routing protocols can automate this process, making it easier to manage and scale the network.
4. **Number of Receivers:** Unicast is a one-to-one communication method, while multicast is a one-to-many communication method. Unicast is typically used for sending data to a specific recipient, while multicast is used for delivering data to multiple recipients who have expressed interest in receiving data for a specific multicast group.

Note

Dynamic routing can be vulnerable to attacks that manipulate routing information.

A combination of both static and dynamic routing may also be appropriate in some cases, such as when you have a core network that uses static routes and branch networks that use dynamic routing protocols.

Example: Adding a Static Unicast Route for Factory Automation

A factory operator wants to create static routes between two production lines to coordinate handoffs in a multistage manufacturing process. Static routes allow packets to traverse different subnets, and will ensure efficient routing of packets between the two production lines, as well as to the central control center. This also improves performance by reducing network congestion, ensuring that packets will not be retransmitted to other devices or other subnets.

Before you begin: Make sure you have correctly configured:

- Each device with an IP address.
- VLANs for each subnet. Refer to [VLAN](#) for more information.
- VLAN assignment to an Interface. Refer to [Network Interfaces](#) for more information.

To create a static route to Production Line 1, do the following:

1. Go to **Routing**→**Unicast Route**→**Static Routes**, and then click **[Add]**.

- **Result:** The **Create new static route** panel appears.

2. Specify all of the following:

Item	Value
Name	Specify a name for the route. Names must not exceed 10 characters. Names are for user reference only and do not affect functionality.
Status	Enable
Destination Address	10.10.10.1 Refers to Production Line 1.
Subnet Mask	24(255.255.255.0) Refers to the subnet mask of the destination address.
Next Hop	10.10.10.254 Refers to the Secure Router LAN1 Interface as the next hop on the network.
Metric	1 Indicates the preference or priority of a particular route, with lower values having higher priority. When multiple static routes are available (or both static and dynamic routing protocols are available), the router uses the Metric value to determine the best route to use. For static routes, a value of 1 is recommended.

3.

Note

The **Destination Address** and **Subnet Mask** identify which traffic forwards to the next hop. For multi-hop entries, the **Subnet Mask** will correspond to the **Destination Address** and not the **Next Hop**.

4. Click **Create**.

Result: The new static routing entry should appear in the routing table.

Results:

Packets meeting the destination criteria will be routed to the appropriate interface and

applicable subnet, and will not be propagated further.

What to do next: Repeat this procedure to add Production Line 2 (10.10.20.1), the Remote Control Center (10.10.40.1), and Other Systems (10.10.30.1) to the Static Routing Table.

Example: Adding Static Multicast Route for Passenger Speed Display

A train operator wants to display current train speed on the PIS (Passenger Information System), requiring the TCMS (Train Control Management System) to share speed information with the PIS. There are multiple displays in multiple cars throughout the train. Multicast static routing allows the TCMS to send a single packet to multiple displays across the train, minimizing traffic congestion and processing overhead. The reduction in the total number of packets on the network can make it easier to manage quality of service and allocate network resources effectively.

Before you begin: Make sure you have correctly configured:

- Each device with an IP address.
- Each display device to join the multicast group (239.1.1.1 in this example). Consult your PIS system documentation for details.
- VLANs for each subnet. Refer to [VLAN](#) for more information.
- VLAN assignment to an Interface. Refer to [Network Interfaces](#) for more information.
- IGMP Snooping as Enabled on the VLAN for the PIS displays. Refer to [VLAN Settings - Edit VLAN Settings](#) for more information.

To create a static multicast route for the PIS Display Group, do the following:

1. Go to **Routing**→**Multicast Route**→**Multicast Route Settings**, make sure **Mode** is set to **Static Multicast Route**, and then click **Apply**.
2. Go to **Routing**→**Multicast Route**→**Static Multicast Route**, and then click **[Add]**.
 - **Result:** The **Create Static Multicast Route** panel appears.
3. Specify all of the following:

Item	Value
Status	Enable
Group Address	239.1.1.1 Refers to the group IP used by the PIS displays. Packets sent to this address will be sent to all devices configured to listen on this IP which also share the other parameters specified in this section.
Source Address Type	Choose Specify Source , and then specify 10.10.20.1 This refers to the Control Unit, ensuring that other potential devices on this interface and VLAN do not generate unnecessary packets and traffic.
Inbound Interface	LAN1 Refers to the interface connecting the TCMS to the Secure Router. Since the TCMS provides the speed data for the displays.
Outbound Interface	LAN2 Refers to the interface connecting the PIS screens to the Secure Router.

4. Click **Create**.

Result: The new static routing entry appears in the routing table.

Results:

Multicast packets from the TCMS meeting the specified criteria will be sent to PIS screens, allowing them to display speed data without generating duplicate or extra packets that might reduce network performance.

Chapter 6

Security Hardening Guide

Security Hardening Guide

This chapter provides an overview of security strategy, standards, and recommended best practices to improve the security landscape.

The threat landscape is constantly evolving, and no security guide can ever provide 100% protection. This chapter is constantly being expanded, and is not exhaustive.

Security Best Practices

Product Security

This section provides essential information on the installation of your product.

Physical Installation Guidelines

Physical protection of devices is vital to network security.

With physical access to devices, prospective attackers can physically bypass security mechanisms, alter network conditions, or plant additional malicious devices in networks. Follow these tips to help reduce the risk of tampering with networking devices by unauthorized personnel.

- Install switch/router in an access-controlled area. To further protect your device from potential physical attacks, it is important to implement appropriate physical security measures. This may include CCTV surveillance, security guards, locks, and access control systems, among other measures. The specific measures you choose should be based on your environment and the level of risk you face.
- Install a Layer 2 switch within the security perimeter. This perimeter can be established by setting up a firewall at the border, as the switch is not designed to be directly connected to the Internet. Note that the switch should not be classified as zone or boundary equipment. Avoid connecting the device directly to the

Internet, as this can leave your network vulnerable to security breaches.

- Follow the Quick Installation Guide included in the package of your device. It contains step-by-step instructions that are easy to follow and will help you set up the device quickly and efficiently.
- Examine and monitor anti-tamper labels applied to the device enclosures. These labels provide a quick and easy way for administrators to determine if the device has been tampered with.
- Deactivate any ports that are not currently in use. Fewer active ports represent fewer avenues of attack. Refer to [Network Interfaces](#) for more information.

Account Management Guidelines

Manage user accounts, set passwords, and restrict access to authorized personnel only.

- Assign the appropriate account privileges.
- Limit the number of users with admin privileges to only those who need to perform device configuration or modifications. For other users, read-only access is sufficient. Moxa devices supports both local account authentication and remote centralized mechanisms, including RADIUS and TACACS+. This allows for flexible and secure access control options.
- Implement good password practices. Good password practices include:
 1. Enabling and configuring a Password Policy to ensure your password meets specified requirements.
 2. Setting the minimum password length to at least eight characters.
 3. Require passwords to have at least one uppercase and lowercase letter, a digit, and a special character.
 4. Setting password expiration.
 5. Updating passwords regularly.
 6. Never sharing passwords.

Refer to [Password Policy](#) for more information about password policies.

Protecting Vulnerable Network Ports

Understand security risks and mitigate them by configuring network ports correctly.

- Changing port numbers for active services, including TCP port numbers for HTTP, HTTPS, Telnet, and SSH.
- Disable any ports that are not in use, as they could pose an unacceptable security risk.
- Use encrypted communication protocols wherever available. Use HTTPS instead of HTTP, SSH instead of Telnet, SFTP instead of TFTP, and SNMPv3 instead of SNMPv1/v2c. Refer to [Network Interfaces](#) for more information.
- Generate new SSL certificates and SSH keys for devices prior to using HTTPS or SSH applications. Refer to [SSH & SSL](#) for more information.

Maintaining Communication Integrity

Ensure that information sent is accurate, complete, and secure.

Maintaining communication integrity reduces risks risk of data corruption or interception, and associated security breaches, data loss, and other negative effects on networks and their users.

- Use encryption.
- Encryption uses mathematical algorithms to convert data into a secret code, making it extremely difficult for people without the correct codes to read or change the data. By using encryption, you can ensure that the data being transmitted is secure and cannot be intercepted by unauthorized users.
- Use digital signatures.
- Digital signatures verify the authenticity and integrity of digital documents or messages. Using a digital signature, you can ensure that the message or document came from the expected sender and has not been altered.

- Implement access control.

Access control restricts access to only authorized users to the network and its resources. By implementing access control measures, such as firewalls or access control lists, you can prevent unauthorized access and reduce the risk of data breaches.

Communication Integrity Features

Moxa devices provide support for VPNs and secure versions of protocols to help maintain communication integrity.

VPN (Virtual Private Network)

VPN is a secure network connection allowing users to access a private network. VPNs use encryption and authentication to protect the data in transit, which makes it difficult for anyone to intercept or tamper with the data. VPNs also provide access control features to ensure only authorized users can access the network. VPNs are commonly used to securely connect remote workers to a company network securely or to allow secure access to restricted resources over the internet.

Refer to [VPN](#) for more information.

HTTPS (Hypertext Transfer Protocol Secure)

HTTPS is a secure version of the regular HTTP protocol for transmitting data over the internet. HTTPS uses TLS (Transport Layer Security) encryption and digital certificates to protect the data in transit from interception, tampering, or eavesdropping.

Refer to [Management Interface](#) for more information.

SSH (Secure Shell)

SSH is a secure protocol for remote terminal login and secure file transfers. SSH uses encryption to protect the data in transit, making it difficult for anyone to intercept or tamper with it. SSH also provides authentication and access control features to ensure only authorized users can access the network.

Refer to [Management Interface](#) for more information.

SFTP (Secure File Transfer Protocol)

SFTP is a secure version of FTP (File Transfer Protocol) that uses encryption to protect the data in transit. SFTP also provides authentication and access control features to ensure only authorized users can access the network.

Refer to [Management Interface](#) for more information.

SNMP v3 (Simple Network Management Protocol version 3)

SNMP v3 is a secure version of the SNMP protocol used for network management and monitoring. SNMP v3 uses encryption and authentication to protect the data in transit, making it difficult for anyone to intercept or tamper with it. SNMP v3 also provides access control features to ensure only authorized users can access the network.

Refer to [SNMP](#) for more information.

Device Access Control Best Practices

Device access control is an essential aspect of network security that helps protect against unauthorized access to network resources.

Unauthorized access can occur through various means, including physical access to network devices, hacking, or social engineering. Without proper access control measures

in place, networks are vulnerable to security breaches, data theft, and other malicious activities.

Device access control is particularly important for organizations that handle sensitive data, such as financial institutions, healthcare providers, and government agencies. By implementing device access control, these organizations can limit access to sensitive information and prevent security breaches. Below are some ways to ensure device access control:

- Use strong passwords. Passwords should be complex and unique for each device. Passwords should also be changed regularly to maintain security. Refer to [Password Policy](#) for further information.
- Implement trusted access lists. Trusted access lists are authorized devices or users allowed to access a particular network resource. Trusted access lists can be managed at the device, network, or application levels. Network administrators can use trusted access lists to ensure that only authorized devices or users can access sensitive resources. Refer to [Trusted Access](#) for further information.
- Implement an L3 firewall. An L3 firewall, also known as a Layer 3 firewall, is a network security device operating at the OSI model's network layer. L3 firewalls can monitor and filter traffic based on IP addresses, ports, protocols, and other network-level attributes. Using L3 firewalls, network administrators can prevent unauthorized access to the network and block potential security threats. Refer to [Firewall](#) for further information.

About Device Integrity and Authenticity

Integrity and authenticity are vital elements of trust within a network.

Device integrity refers to the state of a device being complete, unaltered, and free from any unauthorized changes or modifications.

Authenticity refers to the assurance that the device is genuine and comes from a trusted

source.

Both integrity and authenticity are critical aspects of device security. Methods to sustain these aspects include:

- Configuration Backup & Encryption
- Secure Boot

Configuration Backup and Encryption

Configuration backup and encryption protects a device's sensitive data and configuration by creating an encrypted copy storing it securely. In the event of unauthorized device changes, correct configuration information can be quickly and securely restored.

The process involves creating a backup of the device's configuration and then encrypting it using a strong encryption algorithm. The encrypted backup is then stored securely to prevent unauthorized access. This process is particularly important for devices that store sensitive information, such as network equipment, servers, and other critical infrastructure. Encrypting the configuration backup ensures that the data remains protected even if the backup location is compromised.

Secure Boot

Secure Boot is a security mechanism designed to ensure that devices boot using only software that is verified as trusted. The primary function of Secure Boot is to prevent unauthorized software from running during the boot process. It achieves this by verifying the integrity and authenticity of the bootloader and firmware.

A bootloader refers to the initial software that runs when a device is powered on. Its primary role is to load the device's operating system. Firmware is software embedded within the device that manages and controls the device's hardware functions.

Moxa hardware makes use of cryptographic modules embedded in devices to support

verification processes. The device's ROM (read-only memory) contains approved bootloaders and associated digital certificates, which are used to verify the integrity of the firmware.

When the device boots, the first thing to run is the bootloader. Secure boot checks the digital signature against the certificate stored in ROM. If the signatures match, the boot process continues. If they do not match, or there is evidence of tampering, the boot process halts to prevent potential security breaches.

Device Resource Management and Monitoring

Moxa devices provide a number of features to help customers manage device resources efficiently and monitor security.

Device Resource Monitoring

Network device resource management is essential for network reliability and security. By monitoring use of network resources, administrators can verify that network guidelines are being followed and devices are operating efficiently and effectively.

Proactive monitoring and management of device resources such as CPU utilization, memory utilization, and network traffic allows administrators to identify potential security breaches early, and help avoid network downtime and disruption. For example, abnormal spikes in network traffic or CPU utilization could be indicative of a malware infection or a denial-of-service attack.

Examples of activities to monitor include:

- Connected ports
- CPU usage
- Memory usage

Refer to [Device Summary](#) for more information.

Event Logs

In addition to real-time monitoring and management, Moxa devices provide advanced logging options to help identify security events. Chosen event types can also generate notifications to notify administrators of unusual events where attention is needed, or to feed into larger security monitoring systems.

Moxa devices offer three kinds of logs:

- System Logs, showing details of all system-related event logs
- Firewall logs, showing details of all patterns from layers 3-7, including
 - Trusted Access
 - Malformed Packets
 - DoS Policy
 - Layer 3 – 7 Policy
 - Protocol Filter Policy
- Anomaly Detection & Protection (ADP)
- Intrusion Detection/Prevention System (IDS/IPS)
- Session Control
- VPN logs, showing all VPN-related events

Refer to [Event Log](#) for more information about Event Logs.

Refer to [Event Notifications](#) for more information about Event Notifications.

Refer to [SNMP](#) for more information about SNMP configuration.

Denial of Service (DoS) Protection

In a denial-of-service (DoS) attack, the attacker attempts to overwhelm a target system with a flood of traffic or requests. The deluge of traffic causes the target system to

become paralyzed, and also causes disruptions in networks and online services.

Moxa devices can prevent several types of DoS attacks by rejecting requests which ask for a particular network scan, or rejecting too many such requests in a specified period..

Refer to [DoS Policy setting](#) for more information.

Session Control

Session control refers to managing communication sessions between network objects, such as IP addresses or ports. The management process involves establishing, maintaining, and terminating sessions to ensure secure and reliable communication between various objects. Session control allows administrators to allocate device resources more efficiently by limiting the number of active sessions, and improving network security by dropping unused sessions.

Refer to [Session Control](#) for more information.

Recommended Settings for Services and Features

When prioritizing device security, the first point of assessment is often the network interfaces and services.

By deactivating unneeded interfaces and services, one can reduce potential vulnerabilities and associated security threats. Additionally, activating the appropriate security features enhances early anomaly detection and bolsters the device's defense against cyber attacks.

Common Protocols and Ports

Service Name	Default Port	Default Setting	Security Suggestions
HTTP	TCP 80	Enabled	Disable if possible to avoid leaks from unencrypted traffic.

Service Name	Default Port	Default Setting	Security Suggestions
HTTPS	TCP 443	Enabled	
Telnet	TCP 23	Enabled	Disable if possible to avoid leaks from unencrypted traffic.
SSH	TCP 22	Enabled	
NTP/SNTP	UDP 123	Disabled	Use SNTP to synchronize system time if possible. Enable NTP authentication if possible.
SNMP	UDP 161 UDP 162 TCP 10161 TCP 10162	Disabled	For V1 & V2c, change default community string names, i.e. public & private, to other unique names. For V3, enable SNMP admin account authentication.
Syslog	UDP 514	Disabled	By default, logs are stored in the device, but limited local storage limits the number of saved logs, resulting in missed logs for critical incidence. Sending logs to an external log server can mitigate limitation, decreasing the chance of missing critical logs.
RADIUS	UDP 1812	Disabled	Enabling RADIUS authentication can help administrators manage password changes more efficiently.
Moxa Services	TCP 443 UDP 40404	Enabled	These 2 ports are only used by the Moxa management software. Disable it if you don't use Moxa management software.

Security-Related Functions

Function	Default Setting	Security Suggestions
Firewall	Deny All	Without precise firewall rules configuration, "Allow All" has a higher change to allow unwanted packets going into the protected network, so we highly suggest using "Deny All" instead of "Allow All". Refer to Scenario: Airport Integrated Solutions to learn more about Allow Lists.
Password Policy	Disable	Enable password policy to comply enterprise security policies.
Login policy	Disable	Enable a login policy to heighten resistance against brute force attacks and terminating any inactive login sessions.

Function	Default Setting	Security Suggestions
Malformed Packets Filtering	Disable	The "Malformed Packets Filtering" feature logs events at a user-defined severity level whenever the system discards malformed packets. Depending on the protocols active in your network, you can choose to enable this feature or leave it disabled.
DoS Policy	None	Select a DoS policy according to your network traffic to increase network robustness.
Session control	None	Configure session control policies appropriate for your traffic to improve network reliability.
802.1X over ports	Disable	Enable 802.1X port authentication to block unauthorized LAN access.
Trusted Access	Enabled	By default, the device permits all connections from the LAN attempting to access it. For enhanced security, block all LAN connections attempting to access the device. Then, use a trusted IP list to specify which trusted IPs are allowed access to the device.

Common Threats and Countermeasures

These are examples of common known threats, and suggestions for mitigation.

Incident Category	Detailed Description	Mitigation Suggestions
Tampering & Information Disclosure	An attacker can read or modify data transmitted over HTTP data flow.	Disable HTTP, and replace HTTP transmission with HTTPS.
Tampering & Information Disclosure	An attacker can read or modify data transmitted over Telnet data flow.	Disable Telnet, and replace HTTP transmission by SSH.
Information Disclosure	Data flowing across TFTP may be sniffed by an attacker.	Use SFTP instead of FTP.
Denial of Service	SNMP Server crashes, halts, stops or runs slowly by excessive quires.	Enable rate limit to stop excessive SNMP requests.
Denial of Service	RADIUS Server crashes, halts, stops or runs slowly by excessive quires.	Enable rate limit to stop excessive RADIUS requests.
Repudiation	Devices fail to synchronize a system time with a trusted NTP/SNTP server.	Enable NTP authentication to verify a connection with the trusted NTP/SNTP server.

Refer to:

- [User Interface](#)
- [DoS Policy](#)
- [Time](#)

Recommended Operational Roles and Duties

Adhering to the principle of least privilege reduces risks by ensuring users operate at the minimum privilege required to complete their tasks.

Instead of individual allocation, privilege levels should be tied to specific job functions. For optimized device security, we recommend three distinct privilege levels, each tailored for different management needs:

Administrator

Designated for system management, this privilege level permits:

- Creation and deletion of configuration objects, files, and user accounts.
- Monitoring system status and resources.
- Modifying parameter values.
- Reviewing stored data within the device.

Administrator Responsibilities:

- Reset and periodically change the default administrator password.
- Ensure password complexity aligns with enterprise security policies.
- Manage and authorize individuals with appropriate access privileges.

- Disable non-essential interfaces or network services.
- Enable secure communication protocols to guard against data breaches.
- Regularly update firmware to address potential vulnerabilities.

Supervisor

Tailored for network experts or operators, this privilege grants:

- Monitoring of system status and resources.
- Adjusting values in configuration objects or files.
- Access to review data stored in the device.

Supervisor Responsibilities:

- Continuously monitor system status and resources to maintain device functionality.
- Routinely verify the integrity of device configuration objects and files.
- Manage trusted devices through IP and MAC allowlisting.
- Oversee and respond to system alerts to preempt device failures and security threats.

Auditor

Reserved for audit-focused personnel, this level allows:

- Monitoring of system status and resources.
- Reviewing data stored within the device.

Auditor Responsibilities:

- Regularly inspect logs to identify and assess incidents and their associated risks.

Moxa devices provide three user privilege categories: admin, supervisor, and user. We advise aligning the admin role for administrator users, the supervisor role for supervisor users, and the user role for auditor users.

Refer to:

- [User Accounts](#)

Recommended Patching and Backup Practices

Moxa's guidance on ensuring device security through regular firmware upgrades and configuration backups.

Firmware Upgrade

Moxa continuously releases firmware throughout the product lifecycle to improve features and rectify identified issues. Upon discovering a vulnerability, our approach aligns with the Moxa Product Security Incident Response Team (PSIRT) guidelines, ensuring swift and appropriate action.

Maintaining current firmware on your network devices is vital to maintain security. Using outdated firmware can expose the device to potential threats. We strongly advise periodic firmware updates. We consistently release the latest firmware and software on our official website, along with respective release notes. Check for these updates regularly.

Configuration Backup

For network operators and system administrators, it is essential to regularly back up device configurations. This precaution allows for quick recovery in unforeseen scenarios, such as cyber attacks.

Refer to:

- [Firmware Upgrade](#)
- [Configuration Backup and Restore](#)

Recommendations for Vulnerability Management

As the adoption of the Industrial IoT (IIoT) continues to grow rapidly, security becomes an increasingly high priority.

The Moxa Product Security Incidence Response Team (PSIRT) takes a proactive approach to protect our products from security vulnerabilities and help our customers better manage security risks.

To report vulnerabilities for Moxa products, please submit your findings on the following web page: <https://www.moxa.com/en/support/product-support/security-advisory/report-a-vulnerability>.

For the most up-to-date Moxa security information, please visit our security advisory page: <https://www.moxa.com/en/support/product-support/security-advisory>

Recommendations for Decommissioning

To avoid any sensitive information such as account passwords or network configurations from disclosure, always delete all imported certificates and reset devices to factory default before you decommission your devices.

Using Security Features

Introduction to IPS

IPS (Intrusion Prevention System) is a network security technology used to detect and prevent potential threats in a network.

IPS analyzes the network traffic and identifies potential attacks, including viruses,

worms, malware, and unauthorized access. Once an IPS detects a threat, it takes immediate action to block the attack and protect the security of the network and system. IPS uses signature-based and behavior analysis to identify threats and employs various techniques to protect systems, such as blocking IP addresses and protocols. It is an important component of network security architecture designed to enhance the security of networks and systems, prevent unauthorized access, and protect against data breaches.

What is the difference between IDS and IPS?

IDS (Intrusion Detection System) and IPS are network security systems that help protect against security threats and vulnerabilities.

An IDS monitors network traffic and identifies potential security threats and attacks. When it detects a security threat, it saves logs and generates an alert, which is sent to the security team for further analysis and action. An IDS is a passive security system that only monitors network traffic and does not take any action to prevent or stop an attack.

On the other hand, an IPS monitors network traffic like an IDS, but also takes active measures to prevent security threats and attacks. Additionally, an IPS can block, quarantine, or even terminate network traffic or connections deemed suspicious or malicious. IPS systems often use a set of predefined rules or policies to identify and respond to security threats in real-time.

The main difference between IDS and IPS is that IDS only detects and notifies of potential security threats, while IPS takes action to prevent and stop the security threat. IDS is generally considered a more passive security system, whereas IPS is more proactive and can take immediate action to mitigate security risks.

IPS Applications

IPS is typically used to actively prevent and block unauthorized access or malicious

activities on your network.

IPS is typically used when you want to actively prevent and block unauthorized access or malicious activities on your network. It's a proactive security solution that acts in real-time to prevent potential security threats from entering or leaving your network.

Here are some common applications of IPS:

1. **Protecting critical assets:** IPS can protect mission-critical assets or systems, such as PLCs, factory automation, ICS (Industrial Control System), from external and internal security threats.
2. **Resisting zero-day attacks:** IPS can help you detect and block unknown or zero-day attacks that have not yet been identified by traditional anti-virus or intrusion detection systems.
3. **Real-time threat detection:** IPS systems can provide real-time threat detection and prevention, reducing the risk of data breaches and other security incidents.
4. **Virtual patching:** Even devices with outdated OS can receive up-to-date protection without regular security updates and patches.

In summary, IPS should be used when you want to actively prevent and block security threats in real-time and protect critical assets or comply with specific regulations or standards.

IPS Limitations

The most notable limitation of IPS is that it relies on updated patterns—updated definitions and countermeasures of known threats—to correctly detect and act on threats. To address this issue, Moxa provides regular updates in the form of a security package.

Example: Updating the Network Security Package via the Web GUI

Download the latest Network Security Package from the Moxa and install via the Web

GUI.

Before you begin: Make sure you have purchased an activated an IPS license.

This task uses the Moxa EDR-G9010 series as an example product. Replace this product with your product for each step.

1. From the Moxa support website, navigate to **Resources**→**Software Packages**→**Network Security Package for EDR-G9010 Series**
The Moxa support website is located at <https://www.moxa.com/en/support>.
2. Download the latest version of the Network Security Package to your computer.
3. Open the router's web interface and navigate to **System**→**System Management**→**Software Package Management**→**Network Security Package**.
4. Click **Source**, and then choose **Local**.
5. Click **Select Files**, and then choose a file from your local file system.
6. Click **Upgrade** to start the upgrade process.

The upgrade process will begin, and the result appears at the bottom of the interface.

What to do next:

Confirm that the Network Security Package has been updated by checking the version information from the Package Information Screen. On the web interface, go to **Firewall**→**Advanced Protection**→**Information**→**Package Information**, and check the version listed.

Example: Updating the Network Security Package via MXsecurity

Download the latest Network Security Package from the Moxa website and install with the MXsecurity web console.

Before you begin: Make sure you have purchased an activated an IPS license.

This task uses the Moxa EDR-G9010 series as an example product. Replace this product with your product for each step.

1. From the Moxa support website, navigate to **Resources**→**Software Packages**→**Network Security Package for EDR-G9010 Series**

The Moxa support website is located at <https://www.moxa.com/en/support>.

2. Download the latest version of the Network Security Package to your computer.
3. From the MXsecurity web console, go to **Device Deployment**→**Software Packages**→**Network Security Packages**.
4. Select the secure routers to update, and then click **Upgrade**.

Results: The upgrade process will begin on the selected routers, with the result displayed within seconds.

What to do next:

Confirm that the Network Security Package has been updated by checking the version information from the Package Information Screen. On the MXsecurity web console, go to **Device Deployment**→**Software Packages**, and check the version listed.

Example: Configuring IPS Rules via MXsecurity

Enable IPS rules and observe the generated event from the MXsecurity, the centralized cybersecurity visualization platform.

Before you begin: Make sure you have:

- a configured MXsecurity server
- an active IPS license that supports MXsecurity
- at least one Network Security Package uploaded. See [Example: Updating the Network Security Package via MXsecurity](#) for upload steps.

1. From the MXsecurity web console, go to **Management**→**Policy Profile**.
 2. Click *[Add]*, and then configure:
 - **Profile Name**
 - **Description** (optional)
 3. Select **IPS**, and then choose one of the **Package Versions** from the list.
 4. Enable one or more IPS rules, then click **Apply**.
 - You can choose **Select All** to enable all protection.
- Result:** Your new policy profile is visible in the **Policy Profile** table.
5. To apply the profile, go to **Deployment**→**Policy Profile**.
 6. Select the IPS profile, and then click **Apply**.

Results:

If an IPS event is triggered, you can go to **Logging**→**Firewall**→**IPS** to examine the events.

Example: Configuring IPS rules via WebGUI

Enable and configure IPS rules from device web interfaces.

Before you begin: Make sure you have:

- an active IPS license that supports device-based IPS
1. In the device UI, go to **Firewall**→**Advanced Protection**→**IPS**.
 2. Identify rules to configure:

Choose from:

 - Choose rules from the list
 - Filter rules by clicking *[Filter]*
 - Type search terms in the search box

3. Edit or enable rules by clicking *[Edit]*, then setting **Status** to **Enabled**.

You can toggle multiple rules by selecting them, and then clicking →**Quick Settings, and then setting Status to Enabled**.

Results: Selected rules will now be enabled.

What to do next: You can check the event log to verify to see actions taken by rules by going to **Diagnostics**→**Event Logs and Notifications**→**Event Log**→**Firewall Log**.

Introduction to Firewalls

A firewall is a network security device that monitors and controls incoming and outgoing network traffic based on predetermined security rules.

Its primary function is to create a barrier between a private internal network and the public internet, allowing only authorized traffic to pass through and blocking unauthorized access attempts. They use various techniques to filter network traffic, including packet filtering, stateful inspection, and application filtering. Firewalls are an essential component of network security and are used by individuals, small businesses, and large enterprises to protect their networks from various types of cyber threats, such as viruses, malware, hackers, and other malicious attacks.

Stateful vs. Stateless firewalls

Firewalls can be categorized as either stateful or stateless.

Stateless firewalls, also known as packet filtering firewalls, examine individual packets of data and enforce rules based on information in the packet header, such as source and destination IP addresses or port numbers. Stateless firewalls do not keep track of the state of connections and cannot distinguish between packets belonging to different connections.

Stateful firewalls, on the other hand, keep track of the state of connections and use this

information to enforce rules. They can distinguish between packets belonging to different connections and apply more complex security policies. Stateful firewalls maintain a state table that tracks information such as source and destination IP addresses, port numbers, and connection status.

Overall, stateful firewalls offer more advanced security features and are generally more effective at protecting networks from threats. However, they also require more resources and may be more complex to configure and manage. Stateless firewalls are simpler and more lightweight, but may not provide as much protection against advanced threats.

Categories of Firewall

- Policy (L2,L3~L7) : A policy in firewall function is a set of rules and criteria that are used to determine how traffic is allowed or denied on a network. Firewall policies define the actions that the firewall should take when specific traffic matches the defined criteria.
- Malformed packet: The Malformed Packets function enables the device to record event logs with a user-specified severity whenever malformed packets are dropped by the system.
- Session control: Session control in a firewall is the process of tracking and controlling the flow of network traffic between two endpoints in a network session. Session control to help users protect backend hosts or services and avoid system abnormalities.
- DoS(Denial of Service) policy: The Industrial Secure Router provides 9 different DoS functions for detecting or defining abnormal packet formats or traffic flows. The Industrial Secure Router will drop packets when it either detects an abnormal packet format or identifies unusual traffic conditions.
- Protocol filter policy: The Industrial Secure Router supports industrial protocol filtering, allowing users to inspect network traffic based on specific protocols to detect anomalies and protect your network.

When to Use Firewalls

Firewalls are a fundamental component of network security and are used to protect networks from unauthorized access and cyber threats. It is a static system that filters traffic based on predefined rules, such as source/destination MAC, IP address or port.

1. Prevent unauthorized access to critical assets: Firewalls are used to prevent unauthorized access to critical assets, such as a controller of a system, central monitor system.
2. Safeguarding sensitive data: Firewalls are used to safeguard sensitive data such as financial information, healthcare records, and production data.
3. Complying with regulations: Many industries are subject to regulations that require the use of firewalls to protect sensitive data.

In summary, firewalls are used to control traffic based on predefined rules and focus on access control. Firewalls are often used in combination with other network secure technique, like IPS (Intrusion Prevention System) to provide comprehensive protection against cyber threats.

Scenario: Airport Integrated Solutions

A network system provider is configuring a network for an airport.

Airports rely on intricate network systems to enhance efficiency, elevate safety measures, promote environmental sustainability, and reduce operational expenses.

Sub-Systems in an Airport Network:

A airport network system normally contains several sub-systems to facilitate transportation, such as:

- **Air Traffic Management System (ATMS):** Orchestrates the safe and efficient movement of aircraft.

- **Airport Lighting Control and Monitoring System (ALCMS):** Manages lighting information for approaches, runways, and taxiways.
- **Apron Docking Guide Systems:** Aids aircraft in safe and precise docking at the airport.
- **Apron Management System:** Supervises the activities on the airport apron area, ensuring smooth operations.

Interoperability and Security

For airports to function seamlessly, these sub-systems must intercommunicate while maintaining security against potential threats. The network should facilitate data sharing for regular flight operations while safeguarding critical systems against intrusions.

Moxa's Solution

Moxa's secure routers bolster this integration through policy-based firewalls. These policies, composed of specific rules, selectively permit or deny traffic among subsystems. For instance, designers can authorize control signals from ATMS to ALCMS, while excluding potentially disruptive traffic from other parts of the airport.

Allowlist Firewall Configuration

An allowlist is a network configuration that blocks all traffic except those specifically allowed.

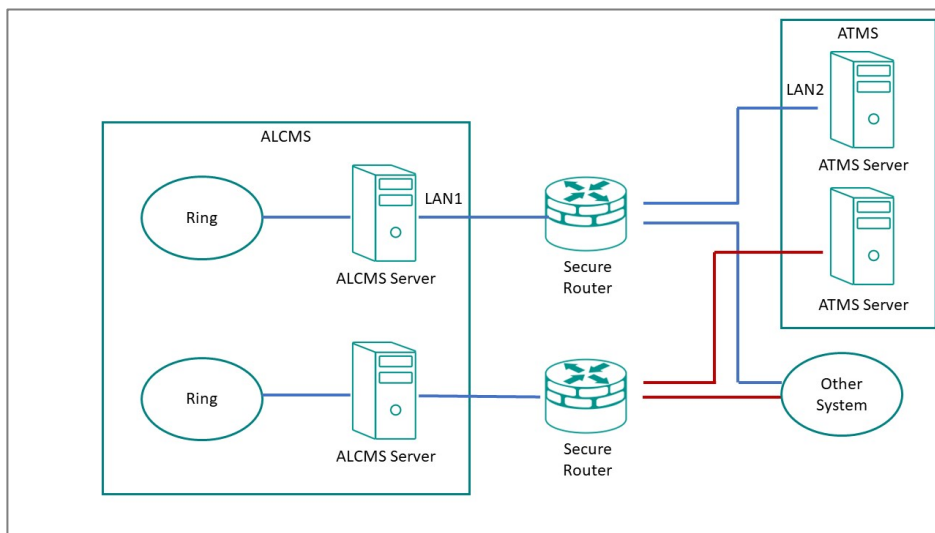

Consider a scenario where the network designer employs dual networks for added redundancy. The firewall's rules can be fine-tuned to:

- Allow the ATMS server to communicate with the ALCMS.
- Reject all unrelated traffic and connections.

To achieve this, set up one or more port filters to allow favorable traffic from recognized

devices or ports. Then, set up a "deny all" rule to block any unspecified traffic, allowing the systems coexist securely on a shared network.

Integrating subsystems while preserving security and redundancy requires meticulous design and strategic solutions. With the right tools and approaches, airports can achieve high levels of operational efficiency and safety.

Example: Allowing ATMS-ALCMS traffic

Create port filtering rules to allow traffic between the ATMS and ALCMS.

This procedure must be used in tandem with a correctly configured "deny all" policy to correctly implement an allowlist.

Before you begin: Make sure that network interfaces have already been configured with static IP addresses.

Note

This example of an allow list relies on fixed IP addresses. Ensure your network is configured accordingly. If the identified characteristics change, the settings will have to be updated.

1. Go to **Firewall** → **Layer 3-7 Policy**, and then click  [Add].

Result: The **Layer 3-7 Policy** creation panel appears.

2. Specify all of the following:

Item	Value
Action	Allow
Filter Mode	IP and Port Filtering
Source IP Address	LAN2 Refers to the ATMS server
Destination IP Address	LAN1 Refers to the ALCMS server.

3. **Tutorial Info:** In this example, these settings identify the "allowed traffic" by IP address. This requires the IP address to be constant. When configuring in a production environment, make sure the characteristics you choose for your filter clearly distinguish trusted and untrusted network objects, such as IP address, protocol and port, or network interface.

Note

Layer 3-7 Policy rules represent a stateful firewall. This means that once the **Source** initiates traffic with **Destination**, two-way traffic will be allowed through the firewall because the firewall will remember the "state" of the connection. However, if there is a possibility that either **Source** or **Destination** may initiate the connection, it may be best to create separate "mirrored" rules to allow connections in both directions. Refer to [Stateful vs. Stateless firewalls](#) for more information.

4. Click **Apply**.

What to do next: Add a policy rule to deny all other traffic to and from the ATMS and ALCMS. See [Example: Configuring Blocked Traffic \(Air\)](#)

Example: Configuring Blocked Traffic (Air)

Once you have specified "allowed" traffic, block all other traffic so that the ATMS and ALCMS systems will be effectively isolated from all other devices.

1. Go to **Firewall** → **Layer 3-7 Policy**, and then click  [Add].

Result: The **Layer 3-7 Policy** creation panel appears.

2. In the **Action** field, select **Deny**.
3. In the **Filter Mode** field, select **IP and Port Filtering**.
4. Click **Apply**.
5. Make sure that the "deny all" rule is the last rule on the list, otherwise this rule may override the allow rules.

To reorder rules, click  [Reorder Priorities]

Results: Traffic between the ATMS and ALCMS systems will be permitted, but all other traffic to and from these systems will be blocked, effectively isolating these systems from other devices on the network. This helps make sure that even if other systems on the network are compromised, no traffic from these systems will reach the ATMS and ALCMS systems, effectively isolating them from this vector of attack.

What to do next:

Tip: Instead of configuring a "deny all" rule, you can configure a policy from **Global Policy Settings** to deny all traffic. To apply the policy:

1. Go to **Firewall** → **Layer 3-7 Policy**
2. Specify **Status** as **Enabled**.
3. Specify **Default Action** as **Deny All**.

4. Click **Apply**.

Specific rules override generalized policies, effectively making the policy the last rule on the list.

Scenario: Railway Integrated Solutions

Short Description: A network system provider is configuring a network for a railway operator.

Understanding Railway Network Topology

A typical railway train network comprises multiple sub-systems working in tandem to ensure smooth operations. These sub-systems communicate crucial information, such as train speed, departure/arrival times, door status, climate control, lighting, and station updates to passengers.

Moxa's secure routers offer firewall functionality that allows seamless integration of these systems. By implementing policy-based firewall rules, these routers can permit authorized traffic and block unauthorized exchanges between the different sub-systems.

For instance, the train operating system might consist of various components:

- T2G system (usually a cellular gateway)
- ATO (Automatic Train Operation) system
- TCMS (Train Control and Management System) ring
- PA (Public Announcement system)/PIS (Public Information System) ring
- Control units for each of these systems

As an example scenario: a network designer might want configure the network such that the TCMS is the gatekeeper for all signals to the ATO, and prevent the ATO from talking to any other node on the network. We can achieve this kind of network isolation with an allowlist.

Allowlist Firewall Configuration

An allowlist is a network configuration that blocks all traffic except those specifically allowed.

To apply our example from above, the firewall's rules can be fine-tuned to:

- Allow the TCMS to access the ATO, PA/PIS, and Cellular Gateway.
- Allow the Cellular Gateway to access the TCMS and PA/PIS system.
- Reject all unrelated traffic and connections.

This configuration effectively isolates the ATO from the Cellular Gateway and PA/PIS.

To implement this configuration, set up one or more port filters to allow favorable traffic from recognized devices or ports. Then, set up a "deny all" rule to block any unspecified

traffic, allowing the systems coexist securely on a shared network.

Integrating subsystems while preserving security and redundancy requires meticulous design and strategic solutions. With the right tools and approaches, operators can achieve high levels of operational efficiency and safety.

Example: Allowing TCMS traffic

Create port filtering rules to allow the TCMS to act as a gatekeeper for other devices on the network.

This procedure must be used in tandem with a correctly configured "deny all" policy to correctly implement an allowlist.

Before you begin: Make sure that network interfaces have already been configured with static IP addresses.

Note

This example of an allow list relies on fixed IP addresses. Ensure your network is configured accordingly. If the identified characteristics change, the settings will have to be updated.

1. Go to **Firewall** → **Layer 3-7 Policy**, and then click *[Add]*.

Result: The **Layer 3-7 Policy** creation panel appears.

2. Specify all of the following:

Item	Value
Action	Allow
Filter Mode	IP and Port Filtering
Source IP Address	LAN2 LAN2 should represent the IP address of the TCMS.
Destination IP Address	LAN1 LAN1 should represent the IP address of the ATO.

3. **Tutorial Info:** In this example, these settings identify the "allowed traffic" by IP address. This requires the IP address to be constant. When configuring in a production environment, make sure the characteristics you choose for your filter clearly distinguish trusted and untrusted network objects, such as IP address, protocol and port, or network interface.

Note

Layer 3-7 Policy rules represent a stateful firewall. This means that once the **Source** initiates traffic with **Destination**, two-way traffic will be allowed through the firewall because the firewall will remember the "state" of the connection. However, if there is a possibility that either **Source** or **Destination** may initiate the connection, it may be best to create separate "mirrored" rules to allow connections in both directions. Refer to [Stateful vs. Stateless firewalls](#) for more information.

4. **Tutorial Info:** In this case, we will specifically create a bidirectional or "mirrored" rule for TCMS to Cellular Gateway traffic.
5. Create two more **Allow** rules.

Rule Purpose	Source IP	Destination IP
Allow TCMS to PA/PIS Traffic	LAN2	LAN3
Allow TCMS to Cellular Gateway Traffic	LAN2	LAN4

6. Click **Apply**.

Results: Rules have been created that will allow the TCMS to access all network nodes, allowing the TCMS to serve as a gatekeeper. Next, create a rule that will allow the Cellular Gateway to access the TCMS and PA/PIS. Refer to [Example: Allowing the T2G to access TCMS and PA/PIS](#) for more information.

Example: Allowing the T2G to access TCMS and PA/PIS

Create port filtering rules to allow traffic from the Cellular Gateway to the TCMS and PA/PIS.

Before you begin: Make sure that network interfaces have already been configured with static IP addresses.

Note

This example of an allow list relies on fixed IP addresses. Ensure your network is configured accordingly. If the identified characteristics change, the settings will have to be updated.

1. Go to **Firewall** → **Layer 3-7 Policy**, and then click  *[Add]*.

Result: The **Layer 3-7 Policy** creation panel appears.

2. Specify all of the following:

Item	Value
Action	Allow
Filter Mode	IP and Port Filtering
Source IP Address	LAN4 LAN4 should represent the IP address of the Cellular Gateway.
Destination IP Address	LAN2 LAN2 should represent the IP address of the TCMS.

3. **Tutorial Info:** In this example, these settings identify the "allowed traffic" by IP address. This requires the IP address to be constant. When configuring in a production environment, make sure the characteristics you choose for your filter clearly distinguish trusted and untrusted network objects, such as IP address, protocol and port, or network interface.

Note

Layer 3-7 Policy rules represent a stateful firewall. This means that once the **Source** initiates traffic with **Destination**, two-way traffic will be allowed through the firewall because the firewall will remember the "state" of the connection. However, if there is a possibility that either **Source** or **Destination** may initiate the connection, it may be best to create separate "mirrored" rules to allow connections in both directions. Refer to [Stateful vs. Stateless firewalls](#) for more information.

4. To allow the Cellular Gateway to access the PA/PIS, specify all of the following:

Item	Value
Action	Allow
Filter Mode	IP and Port Filtering
Source IP Address	LAN4 LAN4 should represent the IP address of the Cellular Gateway.
Destination IP Address	LAN3 LAN3 should represent the IP address of the PA/PIS.

5. Click **Apply**.

Results: Rules have been created that will allow the Cellular Gateway to access the TCMS and PA/PIS.

What to do next: Add a policy rule to block all other traffic. Refer to [Example: Configuring Blocked Traffic \(Rail\)](#) for more information.

Example: Configuring Blocked Traffic (Rail)

Once you have specified "allowed" traffic, block all other traffic so that the ATO will be effectively isolated from all other devices, relying on the TCMS as a gatekeeper.

1. Go to **Firewall** → **Layer 3-7 Policy**, and then click  [Add].

Result: The **Layer 3-7 Policy** creation panel appears.

2. In the **Action** field, select **Deny**.
3. In the **Filter Mode** field, select **IP and Port Filtering**.
4. Click **Apply**.
5. Make sure that the "deny all" rule is the last rule on the list, otherwise this rule may override the allow rules.

To reorder rules, click  [Reorder Priorities]

Results: The TCMS will be able to access all network devices, and the Cellular Gateway will be able to access the TCMS and PA/PIS, but all other traffic will be blocked, effectively isolating these systems from other devices on the network. This helps make sure that even if other systems on the network are compromised, no traffic from these systems will reach the specified systems, effectively isolating them from this vector of attack.

Note

Instead of configuring a "deny all" rule, you can configure a policy from **Global Policy Settings** to deny all traffic. To apply the policy,

6. Go to **Firewall** → **Layer 3-7 Policy**
7. Specify **Status** as **Enabled**.
8. Specify **Default Action** as **Deny All**.
9. Click **Apply**.

Specific rules override generalized policies, effectively making the policy the last rule on the list.

Security Standards and Concepts

Introduction to Defense in Depth

The Defense-in-Depth strategy is used to protect systems from various types of attacks by using multiple independent defense mechanisms.

This involves incorporating multiple layers of security to protect the product against potential attacks and vulnerabilities at various stages of its design, development, and use.

It is crucial to understand that no single protection can guarantee complete security. That's why the Defense-in-Depth approach makes it difficult for attackers to leverage one weakness to attack the product or network as a whole. This approach requires attackers to overcome multiple obstacles undetected, increasing the difficulty level. By leveraging multiple security features and layers of protection in a product, vulnerabilities in any one layer can be mitigated.

AAA

About AAA - Authentication, Authorization, and Accounting

Authentication, **A**uthorization, and **A**ccounting (AAA) is a user-based access control paradigm.

AAA coexists with other security practices. While product security and network security focus on device or process security, AAA focuses on users.

AAA comprises a set of functions for an administrator to determine which users can access a network device, which services are available to authorized users, and collect information about user activities for audits or charging purposes if required. When implemented well, AAA can provide an extra layer of security across different aspects.

Authentication

Authentication provides a method of identifying a user before access to the network device is granted, typically by having the user enter a valid username and password and/or provide a physical token or digital certificate. Additional policies such as a password complexity check or login failure lockout can also increase access security.

Authorization

After authentication is successful, a user can be authorized to use specific resources on the device or perform specific operations. For instance, a normal user with limited permissions may only view the device's system settings, whereas an administrator would have full control to view or edit all system settings.

Accounting

Accounting keeps track of user activities on the device. It monitors the resources a user consumes during network access. This can include the amount of data sent and received through an Ethernet port or the number of user login failures.

About Authentication Types

Handle authentication with the local device exclusively, or with a remote server using local accounts only as a fallback.

It is important to choose the right authentication method, or combination of authentication methods for your network environment and use case. Moxa devices offer the following authentication options.

Local Authentication

Local authentication uses the accounts and settings stored on the local network device to identify users (authentication), determine which services they can use (authorization), and track basic user activities such as amount of data transferred or number of login failures (accounting).

Remote Authentication

Remote authentication uses accounts configured on a RADIUS server - allowing AAA to be configured from a single, centralized location. However, it is important to note that

local authentication is retained as a fallback mechanism to ensure the device can be configured if the RADIUS server becomes inaccessible. Additionally, Moxa products support backup RADIUS servers if the primary becomes inaccessible. Due consideration should be given to the configuration and maintenance of backup servers for redundancy.

Local vs. Remote Authentication Feature Comparison

Features	Local	Remote
Configuration location	Local device	Remote RADIUS server, local as fallback
Number of accounts	Few	Many
Password security requirements	Limited	Many
Allowed services*	Specified locally	Determined by server
Authority types	Admin, User, Supervisor	Admin, User
User feedback on failed login	Custom prompt	Server-defined
Setup effort	Low	High

*Allowed services are usually dependent on Authority types.

Example: Creating a Local User

Local accounts are authenticated and managed by the local device, and function even when remote RADIUS servers are unavailable.

Before you begin: Make sure you have an account with **Admin** authority.

In this example, create a local user with simple **User** level authority to fill the Authentication of the AAA tripod. Once the user has been created, add additional access controls.

1. Using an account with **Admin** authority, log in to the network device.
2. Go to **System**→**Account Management**→**User Accounts**, and then click the plus

icon.

Result: The **Create New Account** panel appears.

3. Set **Status** to Enabled.
4. In the **Username** field, type Nick.
5. Set **Authority** as **User**.
6. In the **New Password** field, type 1qaz!@#\$, and then type again to confirm.
7. Click **Create**.

Results: By creating the user **Nick**, Authorization and Accounting details can now be configured.

The screenshot shows a 'Create New Account' form with the following fields and values:

- Status ***: Enabled
- Username ***: Nick
- Authority ***: User
- New Password ***: 1qaz!@#\$ (8 / 16 characters)
- Confirm Password ***: 1qaz!@#\$ (8 / 16 characters)

At the bottom right, there are two buttons: 'CANCEL' and 'CREATE'.

What to do next: Now that a user account has been created, add account controls. Account controls allow setting a warning for incorrect passwords, account lockouts, and automatic logout. For details, see [Example: Configuring Account Controls for Local Users](#).

Example: Configuring Account Controls for Local Users

Login Failure Account Lockout and Auto Logout increase the security of local accounts.

Enabling additional account controls can increase resistance to brute-force attacks as well as enable troubleshooting. This example demonstrates how to set account lockouts after failed login attempts and manage idle users.

1. Using an account with **Admin** authority, log in to the network device.
2. Go to **Security**→**Device Security**→Login Policy.

Result: The **Login Policy** panel appears.

3. In the **Login Authentication Failure Message** field, type `Warning! The account will be temporarily locked if there are too many consecutive login failures..`
4. Set **Login Failure Account Lockout** to **Enabled**.
5. In the **Login Failure Retry Threshold** field, type 3.
 - This is the number of failed attempts before the user account will be temporarily blocked.
 - Temporary bans can help prevent password guessing and brute force attacks by preventing attackers from rapidly guessing many passwords.
6. In the **Lockout Duration** field, type 5.

This specifies the number of minutes the account will be locked.
7. In the **Auto Lockout After** field, type 30.

This is the amount of time in minutes before inactive accounts automatically log out.

Login Policy

Login Message

0 / 512

Login Authentication Failure Message

Warning! The account will be temporarily locked if there are too many consecutive login failures.

97 / 512

Login Failure Account Lockout

Enabled

Login Failure Retry Threshold *

3

1 - 10 times

Lockout Duration *

5

1 - 10 min.

Auto Logout After *

30

0 - 1440 min.

APPLY

Results: This configuration:

- Displays a warning message on failed login attempts, enabling troubleshooting
- Blocks accounts for five minutes after three unsuccessful login attempts, limiting the effectiveness of credential guessing
- Automatically logs out inactive user accounts after thirty minutes, reducing risks of unauthorized access through idle consoles

What to do next: Optionally, configure allowed access protocols. For details, see [User Interface](#).

Example: Configuring a Remote RADIUS Server

In this example, the RADIUS server handles all Authentication, Authorization, and Accounting.

Before you begin:

- Make sure you have a working RADIUS server and corresponding configuration information. In our example, we use a server that has the following settings:
- **PAP** authentication protocol
- An address of 192.168.127.1
- UDP port 1812
- A preconfigured shared key

Remote Authentication Dial-In User Service (RADIUS) servers may make it easier to manage large numbers of users from a central location.

1. Using an account with **Admin** authority, log in to the network device.
2. Go to **Security**→**Authentication**→**Login Authentication**, and then set **Authentication Protocol** to **RADIUS, Local**.

Tutorial Info: This setting will use the remote RADIUS server as the primary authentication source, and use local authentication as a fallback if the RADIUS server is unavailable.

Note

Enabling RADIUS authentication will not remove local accounts. Make sure local accounts have a strong, unique password. Local accounts are still required both for RADIUS server configuration as well as for local fallback if the RADIUS server is not reachable. For details, see [Example: Creating a Local User](#).

3. Go to **Security**→**Authentication**→**RADIUS**.

Result: The **RADIUS Server** will appear.

4. Configure all of the following:

Field	Setting
Authentication Type	PAP
Server Address 1	192.168.127.1
UDP Port	1812
Shared Key	Enter your Shared Key here.

5. **Tutorial Info:** These configuration options are provided as an example only, and will need to match your network environment.

6. Click **Apply**.

Results:

By configuring remote authentication, the network device will redirect user login requests to the RADIUS server. When logging in with remote user `Peter`, the RADIUS server will process the authentication request and determine whether to grant access to the device. If `Peter` does not match RADIUS or Local information, access will be denied.

In situations where the RADIUS server is not reachable or unavailable, users such as `Nick` (created in [Example: Creating a Local User](#) or other existing local users can still access the network device using their local passwords.

Note

If RADIUS is enabled, but unreachable, network-based logins (HTTP/HTTPS/Telnet/SSH) will not be possible, and users will be limited to logins through the console port only.

ISA/IEC 62443 Standards and Architecture

Security Reference Standards

In the field, large networks are connected through switches and routers. These devices manage all data traffic and serve as the main bridge between devices. However, if these switches and routers are compromised, the repercussions can cascade to all connected devices. To help mitigate this risk, Moxa implements the ISA/IEC 62443-4-2 standard into our network device designs.

Security Standards and Vertical Markets

Industries such as electricity, oil and gas, rail transportation, and maritime have established their own standards for security. These standards include guidelines and regulations designed to address each industry's unique concerns. Among these standards, 62443 is the most comprehensive, covering a wide range of industries and security concerns, making it an excellent choice for organizations that prioritize security in their operations.

ISA/IEC 62443 Standards and Architecture

The ISA/IEC 62443 standard is a set of guidelines and best practices designed to help organizations secure their industrial automation and control systems (IACS) against cyber threats. The framework helps assess risks to IACS and implement appropriate security measures to protect against cyber attacks and malware. The standard consists of multiple parts, with each covering different aspects of industrial cybersecurity.

Breakdown of ISA/IEC 62443

Parts of ISA/IEC 62443	Scope	Sections
ISA/IEC 62443-1	General	Part 1-1: Terminology, concepts, and models Part 1-2: Master glossary of terms and abbreviations Part 1-3: System security compliance metrics Part 1-4: IACS security life cycle and use-cases
ISA/IEC 62443-2	Process and Program requirements	Part 2-1: Establishing an industrial automation and control system security program Part 2-2: Implementation guidance for an IACS security management system Part 2-3: Patch management in the IACS environment Part 2-4: Security program requirements for IACS service providers
ISA/IEC 62443-3	Systems	Part 3-1: Security technologies for industrial automation and control systems Part 3-2: Security risk assessment and system design Part 3-3: System security requirements and security levels
ISA/IEC 62443-4	Components	Part 4-1: Secure product development lifecycle requirements Part 4-2: Technical security requirements for IACS components

Product suppliers adhere to the ISA/IEC 62443 standard to provide components for Industrial Automation and Control System (IACS) solutions. These components can be:

- Individual items
- Combined products forming a system or subsystem

Additionally, system integrators use the following sections of the ISA/IEC 62443 standard:

- IEC 62443-2-1
- IEC 62443-2-4
- IEC 62443-3-2

- IEC 62443-3-3

These standards help integrators:

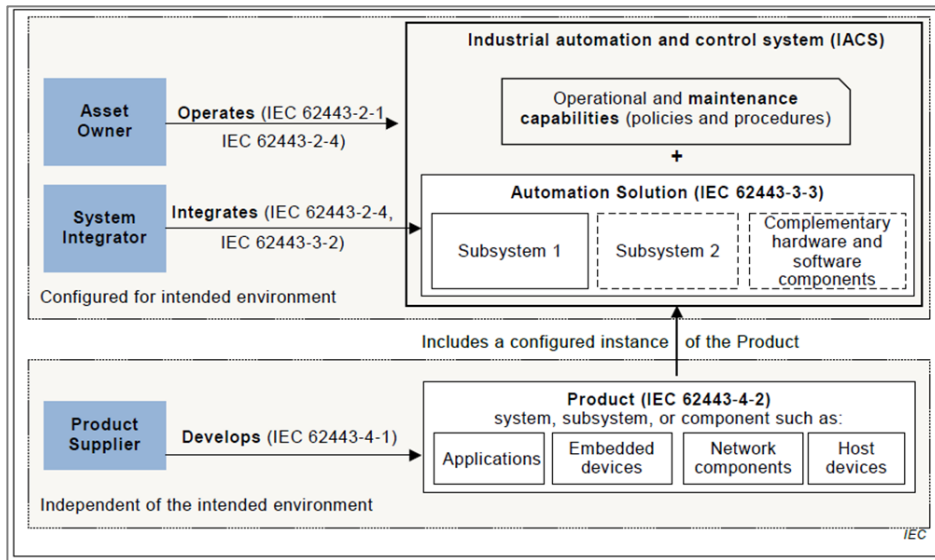

- Determine security zones
- Specify security capability levels for each zone
- Integrate products into an Automation Solution

Key Parts of ISA/IEC 62443 Standard

Parts of the ISA/IEC 62443 Standard	Technical Security Requirements
General ISA/IEC 62443-1	ISA-/IEC 62443-1-1 Foundational Requirements (FR)
System ISA/IEC 62443-3	ISA-/IEC 62443-3-3 System Requirements (SR)
Component ISA/IEC 62443-4	ISA-/IEC 62443-4-2 Component Requirements (CR)

Once the solution is ready, it's installed on-site, becoming a vital part of the IACS.

Summary of IEC 62443 Stakeholders

Establishing Foundational Requirements

ISA/IEC 62443-1-1 Foundational Requirements (FR)

FR 1 Identification and Authentication Control

- FR 2 User Control
- FR 3 System Integrity
- FR 4 Data Confidentiality
- FR 5 Restricted Data Flow
- FR 6 Timely Response to Events
- FR 7 Resource Availability

Once an organization settles on target security levels, foundational requirements can help further specify requirements based on the seven foundational security functions (FRs). The ISA/IEC 62443 framework includes:

- **System Requirements (SRs):** Detailed in Part 3-3, these are guidelines for those

shaping the system's overall architecture.

- **Component Requirements (CRs):** Outlined in Part 4-2, they cater to designers focusing on individual components.

Both system and component designers reference these standards, ensuring the final product's security aligns with what the asset owner's requirements. This methodology not only bolsters the product's defense against specific threat levels but also optimizes resource utilization among stakeholders. As a side note, every FR from Part 1-1 is paired with four distinct security levels, which trace back to standards set in Parts 3-3 and 4-2. For simplicity in cross-referencing, CRs are numerically aligned with their corresponding SRs.

Component Requirements

Part 4-2 extends the SRs from Part 3-3 by introducing CRs tailored for a variety of IACS components.

These components fall under four broad categories of SRs:

- Software Applications
- Embedded Devices
- Host Devices
- Network Devices

While a majority of Part 4-2's criteria are generic and apply uniformly across categories, there are exceptions. Unique, component-specific stipulations are clearly signposted, with exhaustive details available in dedicated clauses. For details, consult the original standards.

Requirement Enhancements

CRs may contain one or more requirement enhancements (RE). REs are additional

requirements attached to CRs that add additional conditions to accommodate higher security levels.

FR 1 Applications: User Identification and Authentication

FR 1 codifies the principle that all users—humans, software processes, or devices—must first be identified and authenticated before accessing the system or assets.

Recognizing the need to verify different kinds of users, FR 1 uses the following CRs:

- **CR 1.1** focuses on human users.
- **CR 1.2** addresses software processes and devices.

Identification vs. Authentication: Consider a person's ID card. While the card identifies its owner, can someone else misuse it? Certainly. Here, the distinction between 'identifying' (matching a person to an ID card) and 'authenticating' (confirming the card holder's authenticity) becomes crucial. Each process has distinct methods and requirements.

Understanding CR and RE in Determining Security Levels: CR represents foundational requirements, whereas RE accounts for advanced needs. Together, they define the security capacity of a component. Each component's security level, according to FR, ranges from 0 (no requirements) to 4.

For instance:

- **Security Level 1:** Implementing basic identification and authentication for all human users.
- **Security Level 2:** Incorporates RE1 - uniquely identify and authenticate users, like using ID cards for employees.
- **Security Level 3:** Engages RE2 - multifactor authentication.

Multifactor Authentication Unraveled: Typically, this methodology hinges on:

- 1. **Knowledge:** Passwords or PINs.
- 2. **Possession:** Devices like smartphones or security keys.
- 3. **Inherence:** Biometrics such as fingerprints.

To achieve Level 3, a combination of at least two of these factors is essential.

Security Levels (SLs) and Attack Types

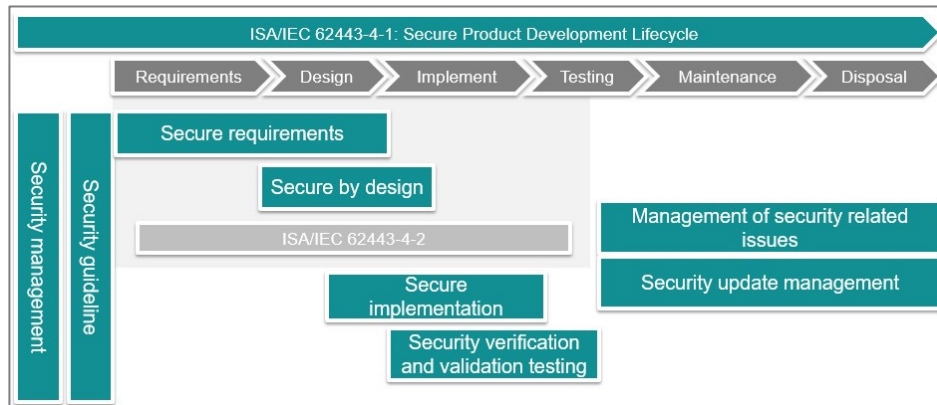

Security Level	Example Threat Actor	Violation Type	Means	Resource Level	Motivation
SL-1	Ordinary user	Coincidental	N/A	N/A	N/A
SL-2	Entry-level hacker	Intentional	Simple	Low	Low
SL-3	Terrorist Organization Organized crime	Intentional	Sophisticated	Moderate	Moderate
SL-4	Nation state	Intentional	Sophisticated	Extended	High

For more information about CRs, SLs, and REs, refer to the ISA/IEC 62443 standard.

Product Lifecycle and Security

Component security plays a role throughout the product lifecycle.

Moxa's Application of ISA/IEC 62443-4-1

How Moxa applies ISA/IEC 62443-4-1

Our commitment to security includes adhering to the ISA/IEC 62443-4-1 standard, considering security at each stage of the product's lifecycle. This includes the safeguarding of our corporate network, keys, secure design and implementation proficiencies, testing processes, and post-sales services. Our approach involves extensive training and certification of all team members associated with product design, execution, and assistance. Moreover, we offer robust support mechanisms like vulnerability handling and patch management.

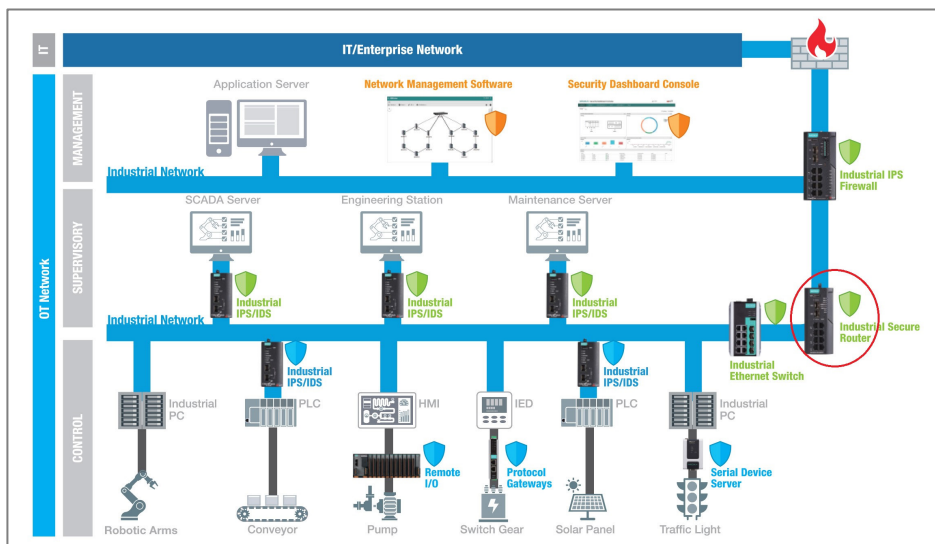

Component Security with IEC 62443-4-2

IEC 62443-4-2 serves as a guide for product suppliers, helping us decipher the specific security capability benchmarks for control system components. This standard not only clarifies which requirements should be assigned but also pinpoints those that must be integral to the components. The fusion of these component requirements with their enhancement requirements defines the component's target security level.

Product Security Context

Security context describes a product's role in a network and the security features of its environment.

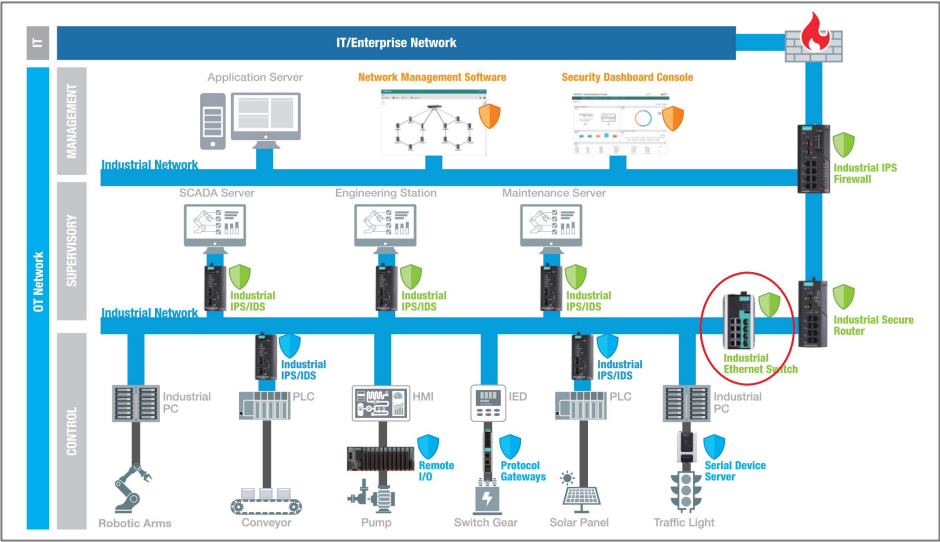

Security Context of an Industrial Secure Router

A secure router is a router with security features. Unlike a firewall—which exclusively filters and controls traffic—a secure router also monitors connections between devices. Secure routers have additional security features such as intrusion detection/prevention systems (IDS/IPS), virtual private network (VPN) support, and advanced encryption capabilities.

Secure router Intrusion Detection Systems (IDS) can be deployed behind the firewall for a defense-in-depth approach, increasing detection of attacks bypassing first-layer firewalls.

Security Context of an Industrial Ethernet Switch

Switches with enhanced security features such as access control lists (ACLs), VLAN support, and support for secure communication protocols, in conjunction with other security measures, can help create a more robust and resilient network.

ACLs and VLANs can help isolate devices on the same physical or logical network segments. This isolation adds further security to minimize or mitigate the effects of an attack.

Chapter 8

Appendix

Appendix

This section includes additional reference information for your device.

The following information is included:

- EtherTypes for Layer 2
- Fiber Check Threshold Values
- IEC 61375-2-3 Communication Identifiers
- IEC-104 Cause of Transmission List
- IEC-104 Type Identification List
- LED Behavior
- MIB Groups
- MMS Command Type List
- MMS Service Operation List
- Severity Level List
- Status Codes
- Structure and Syntax of Consist Info Configuration Files
- Supported Features List
- System Event List
- TRDP Message Type List
- TRDP Protocol Filter Profile List
- User Role Privileges

EtherTypes for Layer 2

The following table shows the Layer 2 protocol types commonly used in Ethernet frames.

EtherType Value (Hexadecimal)	Layer 2 Protocol
0x0800	IPv4 (Internet Protocol version 4)
0x0805	X25
0x0806	ARP (Address Resolution Protocol)
0x0808	Frame Relay ARP
0x08FF	G8BPQ AX.25 Ethernet Packet
0x6000	DEC Assigned proto
0x6001	DEC DNA Dump/Load
0x6002	DEC DNA Remote Console
0x6003	DEC DNA Routing
0x6004	DEC LAT
0x6005	DEC Diagnostics
0x6006	DEC Customer use
0x6007	DEC Systems Comms Arch
0x6558	Trans Ether Bridging
0x6559	Raw Frame Relay
0x80F3	Appletalk AARP
0x809B	Appletalk
0x8100	8021Q VLAN tagged frame
0x8137	Novell IPX
0x8191	NetBEUI
0x86DD	IP version 6 (Internet Protocol version 6)
0x880B	PPP
0x884C	MultiProtocol over ATM
0x8863	PPPoE discovery messages
0x8864	PPPoE session messages
0x8884	Frame-based ATM Transport over Ethernet
0x9000	Loopback

Fiber Check Threshold Values

Model Name	Temperature Threshold (°C)	Max./Min. TX Power (dBm)	Min. RX Power (dBm)
FEMST	120	-11.0/-23.0	-31.0
FEMSC	120	-11.0/-23.0	-31.0
FESSC	120	3.0/-8.0	-34.0
SFP-1FEMLC-T	120	-5.0/-21.0	-37.0
SFP-1FESLC-T	120	3.0/-8.0	-37.0
SFP-1FELLC-T	120	3.0/-8.0	-37.0
SFP-1GSXLC-T	110	-1.0/-12.5	-18.0
SFP-1GLSXLC-T	120	2.0/-12.0	-19.0
SFP-1GLXLC-T	120	0.0/-12.5	-20.0
SFP-1GLHLC-T	120	1.0/-11.0	-23.0
SFP-1GLHXLC-T	120	4.0/-7.0	-24.0
SFP-1GZXLC-T	120	8.0/-3.0	-24.0
SFP-1G10ALC-T	120	0.0/-12.0	-21.0

SFP-1GLHXLC	100	4.0/-7.0	-24.0
SFP-1GZXLC	100	8.0/-3.0	-24.0
SFP-1GEZXLC	100	8.0/-3.0	-30.0

Model Name	Temperature Threshold (°C)	Max./Min. TX Power (dBm)	Min. RX Power (dBm)
SFP-1GEZXC-120	100	6.0/-5.0	-33.0
SFP-1G10ALC	100	0.0/-12.0	-21.0
SFP-1G10BLC	100	-5.0/-21.0	-34.0
SFP-1G20ALC	100	1.0/-11.0	-23.0
SFP-1G20BLC	100	-5.0/-21.0	-34.0
SFP-1G40ALC	100	5.0/-6.0	-23.0
SFP-1G40BLC	100	-5.0/-21.0	-34.0

IEC 61375-2-3 Communication Identifiers

This is a list of IEC 61375-2-3 communication identifier ComIDs and their descriptions.

ComID	Description
0	unspecified PDU
1	ETBCTRL telegram
2	CSTINFO notification message
3	CSTINFOCTRL notification message
10	TRDP Echo
31	TRDP - statistics request command
35	TRDP - global statistics data
36	TRDP - subscription statistics data
37	TRDP - publishing statistics data
38	TRDP - redundancy statistics data
39	TRDP - join statistics data
40	TRDP- UDP listener statistics data
41	TRDP - TCP listener statistics data

ComID	Description
80	Conformance test- control telegram
81	Conformance test - status telegram
82	Conformance test - confirmation request telegram
83	Conformance test - confirmation reply telegram
84	Conformance test - opTrnDir request telegram
85	Conformance test - opTrnDir reply telegram
86	Conformance test - echo request telegram
87	Conformance test - echo reply telegram
88	Conformance test - echo notification telegram
100	TTDB - operational train directory status telegram
101	TTDB - operational train directory notification
102	TTDB - train directory information request
103	TTDB - train directory information reply
104	TTDB - consist information request
105	TTDB - consist information reply
106	TTDB - train network directory information request
107	TTDB - train network directory information reply
108	TTDB - operational train directory information request
109	TTDB - operational train directory information reply
110	TTDB - train information complete request
120	ECSP - control telegram
121	ECSP - status telegram
122	ECSP - Confirmation/Correction request
123	ECSP - Confirmation/Correction reply
130	ETBN - control request
131	ETBN - status reply
132	ETBN - train network directory request
133	ETBN - train network directory reply

ComID	Description
140	TCN-DNS - resolving request telegram (query)
141	TCN-DNS - resolving reply telegram

IEC-104 Cause of Transmission List

This is a list of IEC-104 cause of transmission codes and their descriptions.

Cause	Description
0	not used
1	periodic, cyclic
2	background interrogation
3	spontaneous
4	initialized
5	interrogation or interrogated
6	activation
7	confirmation activation
8	deactivation
9	confirmation deactivation
10	termination activation
11	feedback, caused by distant command
12	feedback, caused by local command
13	data transmission
14-19	reserved for further compatible definitions
20	interrogated by general interrogation
21	interrogated by interrogation group 1
22	interrogated by interrogation group 2
23	interrogated by interrogation group 3
24	interrogated by interrogation group 4
25	interrogated by interrogation group 5

Cause	Description
26	interrogated by interrogation group 6
27	interrogated by interrogation group 7
28	interrogated by interrogation group 8
29	interrogated by interrogation group 9
30	interrogated by interrogation group 10
31	interrogated by interrogation group 11
32	interrogated by interrogation group 12
33	interrogated by interrogation group 13
34	interrogated by interrogation group 14
35	interrogated by interrogation group 15
36	interrogated by interrogation group 16
37	interrogated by counter general interrogation
38	interrogated by interrogation counter group 1
39	interrogated by interrogation counter group 2
40	interrogated by interrogation counter group 3
41	interrogated by interrogation counter group 4
44	type-Identification unknown
45	cause unknown
46	ASDU address unknown
47	Information object address unknown

LED Behavior

This page describes the LED behaviors for different product series.

Note

Please note that some LEDs are only on models with related features.

EDR-8010 Series LED Behavior

LED	Color	State	Description
PWR1	Amber	On	Power is being supplied to power input P1 on the main module.
		Off	Power is not being supplied to power input P1 on the main module.
PWR2	Amber	On	Power is being supplied to power input P2 on the main module.
		Off	Power is not being supplied to power input P2 on the main module.
STATE	Green	On	The system passed the self-diagnosis test on boot-up and is ready to run.
		Blinking	Device reset is in progress, blinking once per second.
		Red	The system failed the self-diagnosis test on boot-up.
MSTR/H.TC	Green	On	The EDR-8010 is set as the Master of the Turbo Ring, or as the Head of the Turbo Chain.
		Blinking	The Turbo Ring or the Turbo Chain is down.
		Off	The EDR-8010 is not set as the Master of this Turbo Ring or is set as a Member of the Turbo Chain.
CPLR/T.TC	Green	On	The EDR-8010 Series' coupling function is enabled to form a backup path, or the device is set as the Tail of the Turbo Chain.
		Blinking	The Turbo Ring or the Turbo Chain is down.
		Off	The EDR-8010 Series' coupling function is disabled, or the device is set as a Member of the Turbo Chain.
VRRP/HA	Green	On	The EDR-8010 is set as the Master of the VRRP or HA.
		Off	The EDR-8010 is not set as the Master of the VRRP or HA.
VPN	Green	On	All VPN tunnels are working normally.
		Amber	Only parts of the VPN tunnels are working normally.
		Off	No active VPN connections.
USB	Green	On	USB drive successfully connected.
		Blinking	USB data is being transmitted.
		Red	USB dongle malfunction.
1G	Green	On	1G SFP link is up.
		Off	No link or the SFP link is down.
10/100 Mbps	Green	On	10 or 100 Mbps copper link is up.

LED	Color	State	Description
		Off	No link or the copper link is down.

EDR-G9010 Series LED Behavior

LED	Color	State	Description
PWR1	Amber	On	Power is being supplied to power input P1 on the main module.
		Off	Power is not being supplied to power input P1 on the main module.
PWR2	Amber	On	Power is being supplied to power input P2 on the main module.
		Off	Power is not being supplied to power input P2 on the main module.
STATE	Green	On	The system passed the self-diagnosis test on boot-up and is ready to run.
		Blinking	Device reset is in progress, blinking once per second.
		Red	The system failed the self-diagnosis test on boot-up.
MSTR/H.TC	Green	On	The EDR-G9010 is set as the Master of the Turbo Ring, or as the Head of the Turbo Chain.
		Blinking	The Turbo Ring or the Turbo Chain is down.
		Off	The EDR-G9010 is not set as the Master of this Turbo Ring or is set as a Member of the Turbo Chain.
CPLR/T.TC	Green	On	The EDR-G9010 Series' coupling function is enabled to form a backup path, or the device is set as the Tail of the Turbo Chain.
		Blinking	The Turbo Ring or the Turbo Chain is down.
		Off	The EDR-G9010 Series' coupling function is disabled, or the device is set as a Member of the Turbo Chain.
VRRP/HA	Green	On	The EDR-G9010 is set as the Master of the VRRP or HA.
		Off	The EDR-G9010 is not set as the Master of the VRRP or HA.
VPN	Green	On	All VPN tunnels are working normally.
		Amber	Only parts of the VPN tunnels are working normally.
		Off	No active VPN connections.
USB	Green	On	USB drive successfully connected.

LED	Color	State	Description
		Blinking	USB data is being transmitted.
	Red	On	USB dongle malfunction.
1G/2.5G	Green	On	2.5G SFP link is up.
	Amber	On	1G SFP link is up.
		Off	No link or the SFP link is down.
10/100/1000 Mbps	Green	On	1000 Mbps copper link is up.
	Amber	On	10/100 Mbps copper link is up.
		Off	No link or the copper link is down.

TN-4900 Series LED Behavior

System LEDs

LED	Color	State	Description
PWR1	Amber	On	Power is being supplied to power input PWR1.
		Off	Power is not being supplied to power input PWR1.
PWR2	Amber	On	Power is being supplied to power input PWR2.
		Off	Power is not being supplied to power input PWR2.
FAULT	Red	On	The corresponding PORT event notification is enabled, and a user-configured event is triggered.
		Off	When the corresponding PORT alarm is enabled and a user-configured event is not triggered, or when the corresponding PORT alarm is disabled.
MSTR/HEAD	Green	On	When the TN router is either the Master of this Turbo Ring, or the Head of this Turbo Chain.

Note

The FAULT LED will be on during the DUT boot up state and while waiting for the system to be ready. Once the system is ready, the FAULT LED will turn off.

LED	Color	State	Description
CPLR/TAIL	Green	Blinking	When the TN router is Ring Master of this Turbo Ring and the Turbo Ring is broken, or it is the Chain Head of this Turbo Chain and the Turbo Chain is broken.
		Off	When the TN router is neither the Master of this Turbo Ring, nor the Head of this Turbo Chain.
		On	When the TN router enables the coupling function to form a back-up path in this Turbo Ring, or it is the Tail of this Turbo Chain.
		Blinking	When Turbo Chain is down.
FAULT + MSTR/HEAD + CPLR/TAIL	Alternating colors	Off	When the TN router disables the coupling function of Turbo Ring, or it is not the Tail of the Turbo Chain.
		Blinking	When importing or exporting files from an ABC-02.

Port LEDs

LED	Color	State	Description
FE Ports (10/100M for copper ports)	Amber	On	FE port's 10 Mbps link is active.
		Blinking	Data is being transmitted at 10 Mbps.
		Off	FE port's 10 Mbps link is inactive.
	Green	On	FE port's 100 Mbps link is active.
		Blinking	Data is being transmitted at 100 Mbps.
		Off	FE port's 100 Mbps link is inactive.
GB Ports (10/100/1000M, for copper ports)	Amber	On	TP port's 10 or 100 Mbps link is active.
		Blinking	Data is being transmitted at 10 or 100 Mbps.
		Off	TP port's 10 or 100 Mbps link is inactive.
	Green	On	TP port's 1000 Mbps link is active.
		Blinking	Data is being transmitted at 1000 Mbps.
		Off	TP port's 1000 Mbps link is inactive.
PoE Ports	Amber	On	Power is being supplied to a Powered Device (PD).
		Off	Power is not being supplied to a Powered Device (PD).

IEC-104 Type Identification List

This is a list of IEC-104 type identification codes and their descriptions.

Process information in monitor direction

Type	Description
1	Single point information
2	Single point information with time tag
3	Double point information
4	Double point information with time tag
5	Step position information
6	Step position information with time tag
7	Bit string of 32 bit
8	Bit string of 32 bit with time tag
9	Measured value, normalized value
10	Measured value, normalized value with time tag
11	Measured value, scaled value
12	Measured value, scaled value with time tag
13	Measured value, short floating-point value
14	Measured value, short floating-point value with time tag
15	Integrated totals
16	Integrated totals with time tag
17	Event of protection equipment with time tag
18	Packed start events of protection equipment with time tag
19	Packed output circuit information of protection equipment with time tag
20	Packed single-point information with status change detection
21	Measured value, normalized value without quality descriptor

Process telegrams with long time tag (7 octets)

Type	Description
30	Single point information with time tag CP56Time2a
31	Double point information with time tag CP56Time2a
32	Step position information with time tag CP56Time2a
33	Bit string of 32 bit with time tag CP56Time2a
34	Measured value, normalized value with time tag CP56Time2a
35	Measured value, scaled value with time tag CP56Time2a
36	Measured value, short floating-point value with time tag CP56Time2a
37	Integrated totals with time tag CP56Time2a
38	Event of protection equipment with time tag CP56Time2a
39	Packed start events of protection equipment with time tag CP56time2a
40	Packed output circuit information of protection equipment with time tag CP56Time2a

Process information in control direction

Type	Description
45	Single command
46	Double command
47	Regulating step command
48	Setpoint command, normalized value
49	Setpoint command, scaled value
50	Setpoint command, short floating-point value
51	Bit string 32 bit

Command telegrams with long time tag (7 octets)

Type	Description
58	Single command with time tag CP56Time2a

Type	Description
59	Double command with time tag CP56Time2a
60	Regulating step command with time tag CP56Time2a
61	Setpoint command, normalized value with time tag CP56Time2a
62	Setpoint command, scaled value with time tag CP56Time2a
63	Setpoint command, short floating-point value with time tag CP56Time2a
64	Bit string 32 bit with time tag CP56Time2a

System information in monitor direction

Type	Description
70	End of initializ

System information in control direction

Type	Description
100	(General-) Interrogation command
101	Counter interrogation command
102	Read command
103	Clock synchronization command
104	(IEC 101) Test command
105	Reset process command
106	(IEC 101) Delay acquisition command
107	Test command with time tag CP56Time2a

Parameter in control direction

Type	Description
110	Parameter of measured value, normalized value
111	Parameter of measured value, scaled value

Type	Description
112	Parameter of measured value, short floating-point value
113	Parameter activation

File transfer

Type	Description
120	File ready
121	Section ready
122	Call directory, select file, call file, call section
123	Last section, last segment
124	Ack file, Ack section
125	Segment
126	Directory
127	QueryLog – Request archive file

MIB Groups

The Industrial Secure Router comes with built-in SNMP (Simple Network Management Protocol) agent software that supports cold start trap, line up/down trap, and RFC 1213 MIB-II.

The standard MIB groups that the Industrial Secure Router series support are:

MIB II.1 – System Group

sysORTable

MIB II.2 – Interfaces Group

ifTable

MIB II.4 – IP Group

ipAddrTable

ipNetToMediaTable

IpGroup

IpBasicStatsGroup

IpStatsGroup

MIB II.5 – ICMP Group

IcmpGroup

IcmpInputStatus

IcmpOutputStats

MIB II.6 – TCP Group

tcpConnTable

TcpGroup

TcpStats

MIB II.7 – UDP Group

udpTable

UdpStats

MIB II.11 – SNMP Group

SnmpBasicGroup

SnmpInputStats

SnmpOutputStats

Public Traps

1. Cold Start
2. Link Up
3. Link Down
4. Authentication Failure

Private Traps

1. Configuration Changed
2. Power On

3. Power Off

4. DI Trap

MMS Command Type List

This is a list of MMS command type codes and command names.

Command Type	Command Name
1	confirmed_RequestPDU
2	confirmed_ResponsePDU
3	confirmed_ErrorPDU
4	unconfirmed_PDU
5	rejectPDU
6	cancel_RequestPDU
7	cancel_ResponsePDU
8	cancel_ErrorPDU
9	initiate_RequestPDU
10	initiate_ResponsePDU
11	initiate_ErrorPDU
12	conclude_RequestPDU
13	conclude_ResponsePDU
14	conclude_ErrorPDU

MMS Service Operation List

This is a list of MMS service operation codes and their names.

Service Operation	Service Operation Name
1	acknowledgeEventNotification
2	alterEventConditionMonitoring
3	alterEventEnrollment
4	createJournal
5	createProgramInvocation

Service Operation	Service Operation Name
6	defineEventAction
7	defineEventCondition
8	defineEventEnrollment
9	defineNamedType
10	defineNamedVariable
11	defineNamedVariableList
12	defineScatteredAccess
13	defineSemaphore
14	deleteDomain
15	deleteEventAction
16	deleteEventCondition
17	deleteEventEnrollment
18	deleteJournal
19	deleteNamedType
20	deleteNamedVariableList
21	deleteProgramInvocation
22	deleteSemaphore
23	deleteVariableAccess
24	downloadSegment
25	eventNotification
26	fileClose
27	fileDelete
28	fileDirectory
29	fileOpen
30	fileRead
31	fileRename
32	getAlarmEnrollmentSummary
33	getAlarmSummary

Service Operation	Service Operation Name
34	getCapabilityList
35	getDomainAttributes
36	getEventActionAttributes
37	getEventConditionAttributes
38	getEventEnrollmentAttributes
39	getNamedTypeAttributes
40	getNamedVariableListAttributes
41	getNameList
42	getProgramInvocationAttributes
43	getScatteredAccessAttributes
44	getVariableAccessAttributes
45	identify
46	informationReport
47	initializeJournal
48	initiateDownloadSequence
49	initiateUploadSequence
50	input
51	kill
52	loadDomainContent
53	obtainFile
54	output
55	read
56	readJournal
57	relinquishControl
58	rename
59	reportActionStatus
60	reportEventActionStatus
61	reportEventConditionStatus

Service Operation	Service Operation Name
62	reportEventEnrollmentStatus
63	reportJournalStatus
64	reportPoolSemaphoreStatus
65	reportSemaphoreEntryStatus
66	reportSemaphoreStatus
67	requestDomainDownLoad
68	requestDomainUpload
69	reset
70	resume
71	start
72	status
73	stop
74	storeDomainContent
75	takeControl
76	terminateDownloadSequence
77	terminateUploadSequence
78	triggerEvent
79	unsolicitedStatus
80	uploadSegment
81	write
82	writeJournal

Severity Level List

This is a list of severity levels and descriptions, which are based on CVSS vulnerability classifications.

Severity	Description
Emergency	System is unusable

Severity	Description
Alert	Action must be taken immediately
Critical	Critical conditions
Error	Error conditions
Warning	Warning conditions
Notice	Normal but significant condition
Informational	Informational messages
Debug	Debug-level messages

Status Codes

This page shows the different status codes for your device.

Note

Available settings and options will vary depending on the product model.

PoE Status Codes

Classification

Classification	Max Power (watts) by PSE Output
0	15.4
1	4
2	7
3	15.4
4	30

Device Type

Item	Description
Not Present	There are no active connections to the port.
802.3at	An IEEE 802.3at PD is connected to the port.
802.3af	An IEEE 802.3af PD is connected to the port.
NIC	A NIC is connected to the port.
Unknown	An unknown PD is connected to the port.
N/A	The PoE function is disabled.

Configuration Suggestion

Item	Description
Disable PoE power output	A NIC or unknown PD was detected; you may want to disable PoE power output for the port.
Select Force Mode	A higher/lower resistance or higher capacitance was detected; you may want to select Force Mode for the port.
Select high power output	An unknown classification was detected; you may want to select High Power output.
Raise the external power supply voltage to greater than 46 VDC	When the external supply voltage is detected at less than 46 V, the system suggests raising the voltage.
Enable PoE function for detection	The system suggests enabling the PoE function.
Select IEEE 802.3at auto mode	When detecting an IEEE 802.3at PD, the system suggests selecting 802.3at Auto mode.
Select IEEE 802.3af auto mode	When detecting an IEEE 802.3af PD, the system suggests selecting 802.3af Auto mode.

Structure and Syntax of Consist Info Configuration Files

A consist info configuration file uses XML syntax to represent consist information. It is composed of the physical vehicle information and the network device information within each vehicle.

The basic file structure is as follows:

```
<?xml version="1.0" encoding="UTF-8"?>
<consistinfo>
  <vehicleinfo>
    <functioninfo>
      </functioninfo>
    </vehicleinfo>
  </consistinfo>
```

consistinfo

The consistinfo element represents consist info. There must be only one consistinfo element per configuration file.

Attributes

There are no attributes for this element.

Child Elements

Name	Description	Valid Range
cstId	Required. Specifies a unique ID for a consist. This is different than the Consist UUID. The suggested naming convention for using a UIC for the cstId is: <i>"UIC" + (numerical part of UIC)</i> For example, the suggested cstId for UIC 508089-43503-8 would be <i>UIC508089435038</i> .	Valid XML element name that is 3 to 15 characters. A hyphen cannot be used as the last character.
cstType	Optional. Specifies the type of the consist.	Valid XML element name that is 3 to 15 characters. A hyphen cannot be used as the last character.
cstOwner	Optional. Specifies the owner of the consist.	Valid XML element name that is 3 to 15 characters. A hyphen cannot be used as the last character.
vehicleinfo	Required. List of vehicle information that belongs to the consist. Refer to vehicleinfo for more information.	The numbers of the vehicle information, ranges from 1 to 32

vehicleinfo

The vehicleinfo element represents vehicle information in the consist. There should be 1 to 32 vehicleinfo elements within a [consistinfo](#) element.

Attributes

Name	Value	Valid Range
leading	Required. Boolean that indicates whether ECSC is attached to this vehicle.	true / false
tractVeh	Optional. Boolean that indicates whether a vehicle has traction.	true / false

Child Elements

Name	Description	Valid Range
vehId	Required. Specifies a unique ID for a vehicle. The suggested naming convention for using a UIC as for the vehId is: <i>"UIC" + (numerical part of UIC)</i> For example, suggested vehId for UIC 508089-43501-2 would be UIC508089435012.	Valid XML element name that is 3 to 15 characters. A hyphen cannot be used as the last character.
vehType	Optional. Specifies the type of vehicle.	Valid XML element name that is 3 to 15 characters. A hyphen cannot be used as the last character.
vehOrient	Required. Specifies the vehicle orientation with respect to the consist direction. same: Indicates that vehicle has the same direction with respect to the consist direction. inverse: Indicates that the vehicle is in the opposite direction with respect to the consist direction.	same / inverse
cstVehNo	Required. Specifies the index of the vehicle within the consist. Indexing starts from consist direction 1 to direction 2. The first vehicle in consist direction 1 is assigned index 1. The second vehicle (next vehicle in direction 2 of first vehicle) has index 2, and so on.	Integer from 1 to 32
functioninfo	Required. List of devices/functional groups information within the vehicle. Refer to functioninfo for more information. Number of devices/function group information ranges from 0 to 1024	Integer from 0 to 1024

functioninfo

The functioninfo element represents device or functional group information in the vehicle. There can be 0 to 1024 functioninfo elements within a vehicleinfo element.

Attributes

There are no attributes for this element.

Child Elements

Name	Description	Valid Range
fctName	Required. Specifies a unique name for the device/functional group. For devices, we suggest using "dev" or "fct" as a prefix for the fctName. Examples: fctDoorCtrl, fctBrake, devHMI For functional groups, which represent multicast addresses, fctName should use "grp" as the prefix. Examples: grpDoorCtrl, grpBrake, grpETBN, grpECSC	Valid XML element name that is 3 to 15 characters. A hyphen cannot be used as the last character.
cnId	Required. Specifies the static CN ID of the ECN this device/functional group connects to. Set this to 0 for functional groups.	Integer from 0 to 32
fctId	Required. Specifies the numeric ID for the device/functional group. Must be different from the Host ID of the ECN. There should be no duplicate combinations of fctId and cnId within a single consist.	Integer from 1 to 32767

System Event List

This is a list of system events and their descriptions.

System Event	Description
Cold Start	Power was cut off and then reconnected.

System Event	Description
Warm Start	The Moxa industrial secure router was rebooted, such as when network parameters are changed (IP address, netmask, etc.).
Power 1 Transition (On->Off)	The Moxa industrial secure router's power 1 is powered down.
Power 1 Transition (Off->On)	The Moxa industrial secure router's power 1 is powered up.
Power 2 Transition (On->Off)	The Moxa industrial secure router's power 2 is powered down.
Power 2 Transition (Off->On)	The Moxa industrial secure router's power 2 is powered up.
Configuration Changed	A configuration setting was changed.
Login Failure	An incorrect password was entered.
802.1X Authentication Failure	An 802.1X authentication failure occurred.
Firmware Upgrade Success	Firmware upgrade was successful.
Firmware Upgrade Failure	An error occurred during the firmware upgrade.
Log Service Ready	Log service is ready.
Ring/RSTP Topology Changed	The Ring/RSTP topology was changed.
Master Mismatch	A Turbo Ring Master mismatch occurred.
Coupling Topology Changed	The Coupling topology was changed.
VRRP State Change	The VRRP state was changed.
VPN Connected	VPN has been connected.
VPN Disconnected	VPN has been disconnected.
Firewall Policy	A firewall policy failure occurred.
PoE PD On	PoE
PoE PD Off	Port#N PD power on.
Over Measured Power limitation	Port#N PD power off.
PoE FETBad	PD Port#N MOSFET is bad.

System Event	Description
PoE Over Temperature	The temperature of the environment exceeds the maximum operating temperature of the router.
PoE VEE Uvlo	VEE (PoE input voltage) under Voltage Lockout. The voltage of the power supply has dropped below 44V DC.
PoE PD Over Current	Current of Port#N has exceeded the safety limit.
PoE PD Check Fail	The router does not receive a PD response from Port#N after the defined period for specific time cycles.
Over Allocated Power limitation	The total PD power consumption exceeds the total allocated power.

TRDP Message Type List

Configuration attribute requirements - msgType

This is a list of TRDP msgTypes and their descriptions.

msgType	Description
Pr	PD Request
Pp	PD Reply
Pd	PD Data
Pe	PD Data (Error)
Mn	Notification (Request without reply)
Mr	MD Request with reply
Mp	MD Reply without confirmation
Mq	MD Reply with confirmation
Mc	MD Confirm
Me	MD error

Configuration attribute requirements - msgType Profile

This is a list of TRDP msgType profiles and their descriptions.

Profile	Description
PD-PDU	A collection of "Pr, Pp, Pd, Pe"
MD-PDU	A collection of "Mn, Mr, Mp, Mq, Mc, Me"

TRDP Protocol Filter Profile List

This is a list of the different built-in protocol filter profiles for common applications and their corresponding message types and communication identifiers.

Protocol Filter Profile	Message Type	Communication Identifier (ComID)
PD-PDU	0x5072: PD Request, 0x5070: PD Reply, 0x5064: PD Data, 0x5065: PD Data (Error)	All
MD-PDU	0x4D6E: Notification (Request without reply), 0x4D72: MD Request with reply, 0x4D70: MD Reply without confirmation, -x4D71: MD Reply with confirmation, 0x4D63: MD Confirm, 0x4D65: MD error	All
Communication Framework and ETB Control Service	All	1-29, 50-79, 150-199
TRDP statistics data	All	30-41
Conformance test	All	80-99
TTDB	All	100-119
ECSP	All	120-129
ETBN	All	130-139
TCN-DNS	All	140-149

User Role Privileges

This page shows the privilege levels granted to the different authority levels: Admin, Supervisor, and User. Refer to [System > Account Management > User Accounts](#) for more information on user accounts.

Privileges are indicated as follows:

- **R/W**: Read and write access granted for the relevant settings
- **R**: Read-only access granted for the relevant settings
- **-**: No access granted for the relevant settings

Note

Available settings and options will vary depending on the product model.
